- Matching to fix order calculations

## Introduction

Think of shower branching as developing in a "time" that goes from most virtual to least virtual.

Real time picture

Shower time picture

Thus shower time proceeds backward in physical time for initial state radiation.

## Density Matrix

The physical cross section is

$$
\left.\begin{array}{rl}
\sigma[F]=\sum_{m} & \int\left[d\{p, f\}_{m}\right] \overbrace{f_{a / A}\left(\eta_{\mathrm{a}}, \mu_{F}^{2}\right)}^{f_{b / B}\left(\eta_{\mathrm{b}}, \mu_{F}^{2}\right)}
\end{array} \frac{1}{2 \eta_{\mathrm{a}} \eta_{\mathrm{b}} p_{A} \cdot p_{B}}\right) \text { parton distributions } \quad \times \underbrace{\underbrace{}_{\text {matrix element }}}_{\text {observable }}
$$

It is useful to write this as trace in the color and spin space

$$
\sigma[F]=\sum_{m} \int\left[d\{p, f\}_{m}\right] \operatorname{Tr}\{\underbrace{\rho\left(\{p, f\}_{m}\right)}_{\text {density operator in color } \otimes \text { spin space }} F\left(\{p, f\}_{m}\right)\}
$$

## Density Matrix

The physical cross section is

## parton distributions

$$
\begin{aligned}
& \sigma[F]=\sum_{m} \int\left[d\{p, f\}_{m}\right] \overbrace{f_{a / A}\left(\eta_{\mathrm{a}}, \mu_{F}^{2}\right) f_{b / B}\left(\eta_{\mathrm{b}}, \mu_{F}^{2}\right)} \frac{1}{2 \eta_{\mathrm{a}} \eta_{\mathrm{b}} p_{A} \cdot p_{B}} \\
& \quad \int\left[d\{p, f\}_{m}\right] \equiv \frac{1}{m!} \prod_{i=1}^{m}\left\{\sum_{f_{i}} \int \frac{d^{4} p_{i}}{(2 \pi)^{4}} 2 \pi \delta_{+}\left(p_{i}^{2}\right)\right\} \sum_{a} \int_{0}^{1} d \eta_{\mathrm{a}} \sum_{b} \int_{0}^{1} d \eta_{\mathrm{b}}
\end{aligned}
$$

It

$$
\times(2 \pi)^{4} \delta\left(\eta_{\mathrm{a}} p_{A}+\eta_{\mathrm{b}} p_{B}-\sum_{i=1}^{m} p_{i}\right)
$$

anq spin space

$$
\sigma[F]=\sum_{m} \int\left[d\{p, f\}_{m}\right] \operatorname{Tr}\{\underbrace{\rho\left(\{p, f\}_{m}\right)}_{\text {density operator in color } \otimes \text { spin space }} F\left(\{p, f\}_{m}\right)\}
$$

## Density Matrix

The density operator is

$$
\rho\left(\{p, f\}_{m}\right)=\left|\mathcal{M}\left(\{p, f\}_{m}\right)\right\rangle \frac{f_{a / A}\left(\eta_{\mathrm{a}}, \mu_{F}^{2}\right) f_{b / B}\left(\eta_{\mathrm{b}}, \mu_{F}^{2}\right)}{2 \eta_{\mathrm{a}} \eta_{\mathrm{b}} p_{A} \cdot p_{B}}\left\langle\mathcal{M}\left(\{p, f\}_{m}\right)\right|
$$

or expanding it on a color and spin basis

$$
\rho\left(\{p, f\}_{m}\right)=\sum_{s, c} \sum_{s^{\prime}, c^{\prime}}\left|\{s, c\}_{m}\right\rangle A\left(\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)\left\langle\left\{s^{\prime}, c^{\prime}\right\}_{m}\right|
$$

We use conventional treatment of spin, thus we have orthogonal basis:

$$
\left\langle\left\{s^{\prime}\right\}_{m} \mid\{s\}_{m}\right\rangle=\prod_{i=\mathrm{a}, \mathrm{~b}, 1, \ldots, m} \delta_{s_{i}}^{s_{i}^{\prime}}
$$

## Density Matrix

In the color space we use a basis which is normalized but not orthogonal:
$\left\langle\{c\}_{m} \mid\{c\}_{m}\right\rangle=1$ but $\quad\left\langle\left\{c^{\prime}\right\}_{m} \mid\{c\}_{m}\right\rangle=\mathcal{O}\left(1 / N_{c}^{2}\right) \quad$ for $\left\{c^{\prime}\right\}_{m} \neq\{c\}_{m}$
It is useful to introduce a dual basis $\left|\{c\}_{m}\right\rangle_{D}$ that is defined by

$$
{ }_{D}\left\langle\left\{c^{\prime}\right\}_{m} \mid\{c\}_{m}\right\rangle=\delta_{\{c\}_{m}}^{\left\{c^{\prime}\right\}_{m}}
$$

and the completeness relations are

$$
1=\sum_{\{c\}_{m}}\left|\{c\}_{m}\right\rangle_{D}\left\langle\{c\}_{m}\right| \quad \text { and } \quad 1=\sum_{\{c\}_{m}}\left|\{c\}_{m}\right\rangle_{D}\left\langle\{c\}_{m}\right|
$$

## Classical States

The set of functions $A\left(\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)$ forms a vector space.
Basis: $\left.\mid\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)$
Completeness relation :
$\left.1=\sum_{m} \int\left[d\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right] \mid\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)\left(\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m} \mid\right.$
where

$$
\int\left[d\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right] \equiv \int\left[d\{p, f\}_{m}\right] \sum_{s_{\mathrm{a}}, s_{\mathrm{a}}^{\prime}, c_{\mathrm{a}}, c_{\mathrm{a}}^{\prime} s_{\mathrm{b}}, s_{\mathrm{b}}^{\prime}, c_{\mathrm{b}}, c_{\mathrm{b}}^{\prime}} \prod_{i=1}^{m}\left\{\sum_{s_{i}, s_{i}^{\prime}, c_{i}, c_{i}^{\prime}}\right\}
$$

Inner product of the basis states:
$\left(\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m} \mid\left\{\tilde{p}, \tilde{f}, \tilde{s}^{\prime}, \tilde{c}^{\prime}, \tilde{s}, \tilde{c}\right\}_{\tilde{m}}\right)=\delta_{m, \tilde{m}} \delta\left(\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m} ;\left\{\tilde{p}, \tilde{f}, \tilde{s}^{\prime}, \tilde{c}^{\prime}, \tilde{s}, \tilde{c}\right\}_{\tilde{m}}\right)$

## Classical State

A physical state which is related to the density matrix:

$$
\left.\mid A)=\int\left[d\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right] A\left(\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right) \mid\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)
$$

or the vector corresponding to the measurement function

$$
\left(F \mid\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)=\left\langle\left\{s^{\prime}, c^{\prime}\right\}_{m}\right| F\left(\{p, f\}_{m}\right)\left|\{s, c\}_{m}\right\rangle
$$

Then the cross section that corresponding to this measurement function is

$$
\sigma[F]=(F \mid A)
$$

## Parton Shower Evolution

We use an evolution variable e.g.:

$$
\log \frac{Q^{2}}{q^{2}}=t \in[0, \infty]
$$

The evolution is given by a linear operator

$$
\left.\mid A(t))=U\left(t, t_{0}\right) \mid A\left(t_{0}\right)\right)
$$

$$
U\left(t_{3}, t_{2}\right) U\left(t_{2}, t_{1}\right)=U\left(t_{3}, t_{1}\right)
$$

Preserves the normalization

$$
\left(1 \mid A\left(t_{0}\right)\right)=1 \quad\left(1\left|U\left(t, t_{0}\right)\right| A\left(t_{0}\right)\right)=1
$$

## Parton Shower Evolution

$$
U\left(t_{3}, t_{1}\right)=\underbrace{N\left(t_{3}, t_{1}\right)}+\overbrace{\int_{t_{1}}^{t_{3}} d t_{2} U\left(t_{3}, t_{2}\right) \mathcal{H}\left(t_{2}\right) N\left(t_{2}, t_{1}\right)}^{\text {Splitting part }}
$$

No-change operator

Group decomposation

$$
U\left(t_{3}, t_{2}\right) U\left(t_{2}, t_{1}\right)=U\left(t_{3}, t_{1}\right)
$$

Preserves the normalization
$\left(1 \mid A\left(t_{0}\right)\right)=1$
$\left(1\left|U\left(t, t_{0}\right)\right| A\left(t_{0}\right)\right)=1$

## Parton Shower Evolution

$$
U\left(t_{3}, t_{1}\right)=\underbrace{N\left(t_{3}, t_{1}\right)}_{\text {No-change operator }}+\overbrace{\int_{t_{1}}^{t_{3}} d t_{2} U\left(t_{3}, t_{2}\right) \mathcal{H}\left(t_{2}\right) N\left(t_{2}, t_{1}\right)}^{\text {Splitting part }}
$$

## Parton Shower Evolution

Start with $2 \rightarrow 2$ cross section and iterate the evolution equation, say, twice:

Gro

Pres

## No-change Operator

The operator $N\left(t^{\prime}, t\right)$ leaves the basis states $\left.\mid\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)$ unchanged

$$
\left.N\left(t^{\prime}, t\right) \mid\left\{p, f, s^{\prime} c^{\prime}, s, c\right\}_{m}\right)=\underbrace{\Delta\left(\left\{p, f, c^{\prime}, c\right\}_{m} ; t^{\prime}, t\right)}_{\text {Sudakov factor }} \mid\left\{p, f, s^{\prime} c^{\prime}, s, c\right\}_{m})
$$

Consistently with the group decomposition property and with the initial condition $N(t, t)=1$ for $\Delta$ we have

$$
\Delta\left(\left\{p, f, c^{\prime}, c\right\}_{m} ; t_{2}, t_{1}\right)=\exp (-\int_{t_{1}}^{t_{2}} d \tau \underbrace{\omega\left(\tau ;\left\{p, f, c^{\prime}, c\right\}_{m}\right)}_{\text {related to the parton splitting }})^{\omega}
$$

## o-change Operator

From the normalization conditions

$$
\left(1\left|U\left(t, t^{\prime}\right)\right|\{p, f, \ldots\}_{m}\right)=\left(1 \mid\{p, f, \ldots\}_{m}\right)
$$

and

$$
\left(1 \mid\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)=\left\langle\left\{s^{\prime}\right\}_{m} \mid\{s\}_{m}\right\rangle\left\langle\left\{c^{\prime}\right\}_{m} \mid\{c\}_{m}\right\rangle
$$

the relation between the splitting operator and $\omega\left(\tau ;\left\{p, f, c^{\prime}, c\right\}_{m}\right)$ is

$$
\left\langle\left\{s^{\prime}\right\}_{m} \mid\{s\}_{m}\right\rangle\left\langle\left\{c^{\prime}\right\}_{m} \mid\{c\}_{m}\right\rangle \omega\left(t,\left\{p, f, c^{\prime}, c\right\}_{m}\right)=\left(1|\mathcal{H}(t)|\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)
$$

At this point we need to discuss the structure of $\mathcal{H}(t)$ !

## Splitting Operator

The splitting operator consists of two terms

$$
\mathcal{H}(t)=\mathcal{H}_{I}(t)+\mathcal{V}(t)
$$

$\mathcal{H}_{I}(t)$ describes the parton splitting and based on the factorization property of the matrix element. It increases the number of partons and changes spins and colors.
$\left(1\left|\mathcal{H}_{I}(t)\right|\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)=2\left\langle\left\{s^{\prime}\right\}_{m} \mid\{s\}_{m}\right\rangle \underbrace{\left\langle\left\{c^{\prime}\right\}_{m}\right| h\left(t,\{p, f\}_{m}\right)\left|\{c\}_{m}\right\rangle}$
non-trivial color structure
At leading order level:

$$
h^{(0)}\left(t,\{p, f\}_{m}\right)=\underbrace{1 P\left(t,\{p, f\}_{m}\right)}_{\text {collinear }}+\sum_{\substack{i, k \\ i \neq k}} \underbrace{T_{i} \cdot T_{k} S_{i k}\left(t ;\{p\}_{m}\right)}_{\text {pure soft }}
$$

## Splititing Operator

The operator $\mathcal{V}(t)$ represents the contributions of the virtual graphs. It keeps the number of partons, flavors, spins unchanged but changes the color.

$$
\begin{aligned}
\mathcal{V}(t) \mid & \left.\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right) \\
= & \left.\sum_{\{\tilde{c}\}_{m}} \mid\left\{p, f, s^{\prime}, c^{\prime}, s, \tilde{c}\right\}_{m}\right)_{D}\left\langle\{\tilde{c}\}_{m}\right| v\left(t,\{p, f\}_{m}\right)\left|\{c\}_{m}\right\rangle\left[1-\delta_{\{c\}_{m}}^{\{\tilde{c}\}_{m}}\right] \\
& \left.+\sum_{\left\{\tilde{c}^{\prime}\right\}_{m}} \mid\left\{p, f, s^{\prime}, \tilde{c}^{\prime}, s, c\right\}_{m}\right)\left\langle\left\{c^{\prime}\right\}_{m}\right| v\left(t,\{p, f\}_{m}\right)\left|\left\{\tilde{c}^{\prime}\right\}_{m}\right\rangle_{D}\left[1-\delta_{\left\{c^{\prime}\right\}_{m}}^{\left\{\tilde{c}^{\prime}\right\}_{m}}\right]
\end{aligned}
$$

The singularities of the virtual graphs cancel those of the real emission graphs, thus the obvious choice is

$$
v\left(\{p, f\}_{m}\right)=-h\left(\{p, f\}_{m}\right)
$$

## Sudakov Exponent

The relation between the splitting operator and the Sudakov exponent is

$$
\left\langle\left\{s^{\prime}\right\}_{m} \mid\{s\}_{m}\right\rangle\left\langle\left\{c^{\prime}\right\}_{m} \mid\{c\}_{m}\right\rangle \omega\left(t,\left\{p, f, c^{\prime}, c\right\}_{m}\right)=\left(1|\mathcal{H}(t)|\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)
$$

From this we have

$$
\omega\left(t,\left\{p, f, c^{\prime}, c\right\}_{m}\right)={ }_{D}\left\langle\{c\}_{m}\right| h\left(\{p, f\}_{m}\right)\left|\{c\}_{m}\right\rangle+\left\langle\left\{c^{\prime}\right\}_{m}\right| h\left(\{p, f\}_{m}\right)\left|\left\{c^{\prime}\right\}_{m}\right\rangle_{D}
$$

where

$$
h^{(0)}\left(t,\{p, f\}_{m}\right)=\underbrace{1 P\left(t,\{p, f\}_{m}\right)}_{\text {collinear }}+\sum_{\substack{i, k \\ i \neq k}} \underbrace{\boldsymbol{T}_{i} \cdot T_{k} S_{i k}\left(t ;\{p\}_{m}\right)}_{\text {pure soft }}
$$

## omments

- The Sudakov exponent exponentiates the color conserving part of the inclusive splitting operator $h\left(t,\{p, f\}_{m}\right)$. Fortunately the leading color part always conserves the color.
- The subleading color part is not exponentiated but it is subtracted. These contributions are treated perturbatively like the splitting terms in $\mathcal{H}_{I}(t)$.
- Thus we have two perturbative parameters:

$$
\alpha_{s} \quad \text { and } \quad \frac{1}{N_{c}^{2}}
$$

## Leading Color Approx.

Neglecting all the $1 / N_{c}^{2}$ contributions the color basis becomes orthogonal and the dual basis is identical to the color basis:

$$
\left|\{c\}_{m}\right\rangle_{D}=\left|\{c\}_{m}\right\rangle+\mathcal{O}\left(1 / N_{c}^{2}\right)
$$

No subtraction: $\quad \mathcal{V}(t)=\mathcal{O}\left(1 / N_{c}^{2}\right)$

The Sudakov factor exponentiates the whole inclusive splitting function

$$
\omega\left(t,\left\{p, f, c^{\prime}, c\right\}_{m}\right)=2\left\langle\{c\}_{m}\right| h\left(\{p, f\}_{m}\right)\left|\{c\}_{m}\right\rangle+\mathcal{O}\left(1 / N_{c}^{2}\right)
$$

## Splititing Operałor

The splitting operator is based on the soft and collinear factorization formulas. At LO level we have

$$
\mathcal{H}_{I}(t)=\mathcal{D}_{\mathrm{a}}(t)+\mathcal{D}_{\mathrm{b}}(t)+\sum_{i=1}^{m} \mathcal{D}_{i}(t)+\mathcal{O}\left(\alpha_{s}^{2}\right)
$$

- The splitting kernel is organized according to the collinear splittings (even the soft radiations)
- This decomposition can be also done at higher order level.
- We need to define phase space mapping to get $m+1$ parton configurations from $m$ parton configurations. This can be also done systematically even for higher order.
- It is important that the phase space mapping must be exact since the classical states are defined on phase space surface in the momentum space.
- The mapping must be consistent with the higher order; e.g. we cannot use the Catani-Seymour dipole factorization and phase space mapping.

## Shower Cross Section

The evolution starts from the kinematically simplest configuration and the shower cross section is

$$
\sigma[F]=\left(F\left|D\left(t_{\mathrm{f}}\right) U\left(t_{\mathrm{f}}, t_{2}\right)\right| \mathcal{M}_{2}\right)
$$

$D\left(t_{\mathrm{f}}\right)$ represents the hadronization. Tuning is allowed only here.

If we have an leading order shower than the corresponding hard configuration should based on the tree level matrix elements.

- Having the LO shower defined, we can calculate any cross section, 2-jet, 3-jet,...
- Only the $2 \rightarrow 2$ Born matrix elements are considered.
- For 3-jet we should consider at least the $2 \rightarrow 3$ Born matrix elements.
- Since $\alpha_{s}$ is large it would be useful to consider the contributions of $2 \rightarrow 4$ Born and $2 \rightarrow 3$ 1-loop matrix elements in the 3-jet calculation.

## Matching at Born Level

Standard shower

Small $p_{T}$ approximation

$|\mathcal{M}|^{2}$

- The shower approximation relies on the small $p_{T}$ splittings.
- May be the exact matrix element would be better.
- But that lacks the Sudakov exponents.

## Matching at Born Level

Standard shower

Small $p_{T}$ approximation

$|\mathcal{M}|^{2}$

## Adjoint Splitting Operator

Let us define the operator $\mathcal{H}^{\dagger}(t)$ according to

$$
\begin{gathered}
(F|\mathcal{H}(t)| A)=\left(A\left|\mathcal{H}^{\dagger}(t)\right| F\right) \\
\mathcal{H}^{\dagger}(t)=\mathcal{H}_{I}^{\dagger}(t)+\mathcal{V}^{\dagger}(t)
\end{gathered}
$$

Since $\mathcal{H}_{I}(t)$ always increases the number of partons $\mathcal{H}_{I}^{\dagger}(t)$ always decreases it. This operator is the fully exclusive version of the fix order calculation's subtraction terms.
For multiple emission:

$$
\begin{aligned}
& \left(F\left|\mathcal{H}\left(t_{m}\right) \mathcal{H}\left(t_{m-1}\right) \cdots \mathcal{H}\left(t_{1}\right)\right| A\right) \\
& \quad=\left(A\left|\mathcal{H}^{\dagger}\left(t_{1}\right) \cdots \mathcal{H}^{\dagger}\left(t_{m-1}\right) \mathcal{H}^{\dagger}\left(t_{m}\right)\right| F\right)
\end{aligned}
$$

## Approximated Matrix Element

For a given m-parton configuration the Born level approximated matrix element is

$$
\left(\mathcal{A}_{m} \mid\{p, f, \ldots\}_{m}\right)=\int_{t_{2}}^{t_{f}} d t_{3} \cdots \int_{t_{m-1}}^{t_{f}} d t_{m}\left(\mathcal{M}_{2}\left|\mathcal{H}_{I}^{\dagger}\left(t_{3}\right) \mathcal{H}_{I}^{\dagger}\left(t_{4}\right) \cdots \mathcal{H}_{I}^{\dagger}\left(t_{m}\right)\right|\{p, f, \ldots\}_{m}\right)
$$

The matrix element reweighting factor is

$$
w_{M}=\frac{F}{\mathcal{E}} / \sqrt[\square]{\square}= \begin{cases}\frac{\left(\mathcal{M}_{m} \mid\{p, f, . .\}_{m}\right)}{\left(\mathcal{A}_{m} \mid\{p, f, \ldots\}_{m}\right)} & \text { if } \mathcal{M}_{m} \text { is known } \\ 1 & \text { otherwise }\end{cases}
$$

and the reweighting operator is

$$
\begin{aligned}
W_{M}\left(t_{\mathrm{f}}, t_{2}\right)=\sum_{m} \int & {\left.\left[d\{p, f, \ldots\}_{m}\right] \mid\{p, f, . .\}_{m}\right)\left(\{p, f, . .\}_{m} \mid\right.} \\
& \times w_{M}\left(\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)
\end{aligned}
$$

## Approximated Matrix Element

For a given m-parton configuration the Born level approximated matrix element is

$$
\left(\mathcal{A}_{m} \mid\{p, f, \ldots\}_{m}\right)=\int_{t_{2}}^{t_{f}} d t_{3} \cdots \int_{t_{m-1}}^{t_{f}} d t_{m}\left(\mathcal{M}_{2}\left|\mathcal{H}_{I}^{\dagger}\left(t_{3}\right) \mathcal{H}_{I}^{\dagger}\left(t_{4}\right) \cdots \mathcal{H}_{I}^{\dagger}\left(t_{m}\right)\right|\{p, f, \ldots\}_{m}\right)
$$

The matrix element reweighting factor is

$$
w_{M}=\frac{E}{-} / \sqrt{-} / \int= \begin{cases}\frac{\left(\mathcal{M}_{m} \mid\{p, f, . .\}_{m}\right)}{\left(\mathcal{A}_{m} \mid\{p, f, \ldots\}_{m}\right)} & \text { if } \mathcal{M}_{m} \text { is known } \\ 1 & \text { otherwise }\end{cases}
$$

and th

$$
\begin{aligned}
=\int_{t_{2}}^{t_{\mathrm{f}}} d t_{3} & \int_{t_{3}}^{t_{\mathrm{f}}} d t_{4} N\left(t_{\mathrm{f}}, t_{4}\right) W_{M}\left(t_{\mathrm{f}}, t_{2}\right) \\
& \left.\times \mathcal{H}_{I}\left(t_{4}\right) N\left(t_{4}, t_{3}\right) \mathcal{H}_{I}\left(t_{3}\right) N\left(t_{3}, t_{2}\right) \mid \mathcal{M}_{2}\right)
\end{aligned}
$$

## Matching at Born level

At leading color level when $\mathcal{V}(t)=0$ we have

Expanding one step of the shower

$$
\left.\left.\left.\mid A\left(t_{\mathrm{f}}\right)\right)=N\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)+\int_{t_{2}}^{t_{\mathrm{f}}} d t_{3} U\left(t_{\mathrm{f}}, t_{3}\right)\left(\mathcal{H}_{I}\left(t_{3}\right)+\mathcal{V}\left(t_{t}\right)\right) N\left(t_{3}, t_{2}\right) \mid \mathcal{M}_{2}\right)
$$

Assuming that we know the $2 \rightarrow 3$ Born matrix elements

$$
\left.\left.\left.\mid A_{M}\left(t_{\mathrm{f}}\right)\right)=N\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)+\int_{t_{2}}^{t_{\mathrm{f}}} d t_{3} U\left(t_{\mathrm{f}}, t_{3}\right)\left(W_{M}\left(t_{\mathrm{f}}, t_{2}\right) \mathcal{H}_{I}\left(t_{3}\right)+\mathcal{V}\left(t_{t}\right)\right) N\left(t_{3}, t_{2}\right) \mid \mathcal{M}_{2}\right)
$$

## Matching at Born level

At leading color level when $\mathcal{V}(t)=0$ we have

Expanding one step of the shower

$$
\left.\left.\left.\mid A\left(t_{\mathrm{f}}\right)\right)=N\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)+\int_{t_{2}}^{t_{\mathrm{f}}} d t_{3} U\left(t_{\mathrm{f}}, t_{3}\right)\left(\mathcal{H}_{I}\left(t_{3}\right)+\mathcal{V}\left(t_{t}\right)\right) N\left(t_{3}, t_{2}\right) \mid \mathcal{M}_{2}\right)
$$

Assuming that we know the $2 \rightarrow 3$ Born matrix elements

$$
\left.\left.\left.\mid A_{M}\left(t_{\mathrm{f}}\right)\right)=N\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)+\int_{t_{2}}^{t_{\mathrm{f}}} d t_{3} U\left(t_{\mathrm{f}}, t_{3}\right)\left(W_{M}\left(t_{\mathrm{f}}, t_{2}\right) \mathcal{H}_{I}\left(t_{3}\right)+\mathcal{V}\left(t_{t}\right)\right) N\left(t_{3}, t_{2}\right) \mid \mathcal{M}_{2}\right)
$$

## Maiching at Born Level

After some algebra

$$
\left.\mid A_{M}\left(t_{\mathrm{f}}\right)\right)=\underbrace{\left.U\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)}_{\text {Standard shower }}+\int_{t_{2}}^{t_{\mathrm{f}}} d t_{3} U\left(t_{\mathrm{f}}, t_{3}\right) \underbrace{\left[W_{M}\left(t_{\mathrm{f}}, t_{2}\right), \mathcal{H}_{I}\left(t_{3}\right)\right]}_{W_{M}\left(t_{\mathrm{f}}, t_{2}\right) \mathcal{H}_{I}\left(t_{3}\right)-\mathcal{H}_{I}\left(t_{3}\right) W_{M}\left(t_{\mathrm{f}}, t_{2}\right)} N\left(t_{3}, t_{2}\right) \mid \mathcal{M}_{2})
$$

The second term doesn't change the LL and NLL structure

$$
\left.\left.\left.\left[W_{M}\left(t_{\mathrm{f}}, t_{2}\right), \mathcal{H}_{I}\left(t_{3}\right)\right] \mid \mathcal{M}_{2}\right) \sim \mid \mathcal{M}_{3}\right)-\mathcal{H}_{I}\left(t_{3}\right) \mid \mathcal{M}_{2}\right)
$$

Assuming we know $\mathcal{M}_{3}, \mathcal{M}_{4}, \ldots, \mathcal{M}_{N}$ then

$$
\begin{aligned}
& \left.\left.\mid A_{M}\left(t_{\mathrm{f}}\right)\right)=U\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right) \\
& \quad+\sum_{m=3}^{N} \int_{t_{2}}^{t_{\mathrm{f}}} d t_{3} \int_{t_{3}}^{t_{\mathrm{f}}} d t_{4} \cdots \int_{t_{m-1}}^{t_{\mathrm{f}}} d t_{m} U\left(t_{\mathrm{f}}, t_{m}\right)\left[W_{M}\left(t_{\mathrm{f}}, t_{2}\right), \mathcal{H}_{I}\left(t_{m}\right)\right] \\
& \left.\quad \times N\left(t_{m}, t_{m-1}\right) \mathcal{H}_{I}\left(t_{m-1}\right) N\left(t_{m-1}, t_{m-2}\right) \cdots \mathcal{H}_{I}\left(t_{3}\right) N\left(t_{3}, t_{2}\right) \mid \mathcal{M}_{2}\right)
\end{aligned}
$$

## Matching at Born Level

There is another way to do the reweighting

## 

$$
\begin{aligned}
& W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t\right)=\left.\sum_{m} \int\left[d\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right] \mid\{p, f, . .\}_{m}\right)\left(\{p, f, . .\}_{m} \mid\right. \\
& \times \lim _{\delta \rightarrow 0} \int_{t_{2}}^{t} d t_{m-1} \int_{t_{2}}^{t_{m-1}} d t_{m-2} \cdots \int_{t_{2}}^{t_{4}} d t_{3} \\
& \times \frac{\left(\mathcal{M}_{2}\left|N\left(t_{3}, t_{2}\right) \mathcal{H}_{I}^{\dagger}\left(t_{3}\right) \cdots N\left(t, t_{m-1}\right) \mathcal{H}_{I}^{\dagger}(t)\right|\{p, f, . .\}_{m}\right)}{\left(\mathcal{A}_{m}\left(t_{\mathrm{f}}, t_{2}\right) \mid\left\{p, f, s^{\prime}, c^{\prime}, s, c\right\}_{m}\right)+\delta}
\end{aligned}
$$

## Matching at Born Level

The improved shower formulae is

$$
\begin{aligned}
\left.\left.\mid A_{\Delta}\left(t_{\mathrm{f}}\right)\right)=U\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)+\sum_{m=3}^{N} \int_{t_{2}}^{t_{\mathrm{f}}} d t_{m} U\left(t_{\mathrm{f}}, t_{m}\right)\left[W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{m}\right) \mid \mathcal{M}_{m}\right) \\
\left.\left.-\mathcal{H}_{I}\left(t_{m}\right) \int_{t_{2}}^{t_{m}} d t^{\prime} N\left(t_{m}, t^{\prime}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t^{\prime}\right) \mid \mathcal{M}_{m-1}\right)\right]
\end{aligned}
$$

and at leading color level this is even simpler

$$
\begin{aligned}
\left.\mid A_{\Delta}\left(t_{\mathrm{f}}\right)\right)= & \left.\left.N\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)+\sum_{m=3}^{n-1} \int_{t_{2}}^{t_{\mathrm{f}}} d t_{m} N\left(t_{\mathrm{f}}, t_{m}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{m}\right) \mid \mathcal{M}_{m}\right) \\
& \left.+\int_{t_{2}}^{t_{\mathrm{f}}} d t_{n} U\left(t_{\mathrm{f}}, t_{n}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{n}\right) \mid \mathcal{M}_{n}\right)
\end{aligned}
$$

## Matching at Born Level

The improved shower formulae is

and at leading color level this is even simpler

$$
\begin{aligned}
\left.\mid A_{\Delta}\left(t_{\mathrm{f}}\right)\right)= & \left.\left.N\left(t_{\mathrm{f}}, t_{2}\right) \mid \mathcal{M}_{2}\right)+\sum_{m=3}^{n-1} \int_{t_{2}}^{t_{\mathrm{f}}} d t_{m} N\left(t_{\mathrm{f}}, t_{m}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{m}\right) \mid \mathcal{M}_{m}\right) \\
& \left.+\int_{t_{2}}^{t_{\mathrm{f}}} d t_{n} U\left(t_{\mathrm{f}}, t_{n}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{n}\right) \mid \mathcal{M}_{n}\right)
\end{aligned}
$$

## CKKW without Equations

Two steps calculation

CKKW break the evolution into $0<t<t_{\text {ini }}$ and $t_{\text {ini }}<t<t_{\text {f }}$

## CKKW@NLO

ZN and D. Soper, hep-ph/0503053

- CKKW use improve weighting for $0<t<t_{\text {ini }}$
- For $t_{\mathrm{ini}}<t<t_{\mathrm{f}}$ they have standard shower with transverse momentum veto
- They use the kT algorithm and NLL Sudakov factors to do the reweighting.

## NLO Calculations

The NLO fix order calculations can be organized by the following way

$$
\begin{aligned}
\sigma_{\mathrm{NLO}}= & \int_{N} d \sigma^{B}+\int_{N+1}\left[d \sigma^{R}-d \sigma^{A}\right] \\
& +\int_{N}\left[d \sigma^{B} \otimes \boldsymbol{I}(\epsilon)+d \sigma^{V}\right]_{\epsilon=0}+\int_{N} d \sigma^{B} \otimes\left[\boldsymbol{K}+\boldsymbol{P}\left(\mu_{F}\right)\right]
\end{aligned}
$$

The Born $\left(d \sigma^{B}\right)$ and the real $\left(d \sigma^{R}\right)$ are based on the N and $\mathrm{N}+1$ parton matrix elements, respectively and $d \sigma^{V}$ is the contribution of the virtual graphs. The operators $\boldsymbol{I}(\epsilon), \boldsymbol{K}, \boldsymbol{P}$ are universal.

It is useful to define the subtraction term based on the shower splitting operator

$$
d \sigma^{A} \sim \int_{0}^{\infty} d t\left(\mathcal{M}_{N}\left|\mathcal{H}_{I}^{\dagger}(t)\right|\{p, f, \ldots\}_{N+1}\right)
$$

## Marching at NLO level

Let us calculate the N -jet cross section. The matrix element improved cross section is

$$
\begin{aligned}
\left(F_{N} \mid A_{\Delta}\left(t_{\mathrm{f}}\right)\right)= & \int_{t_{2}}^{t_{\mathrm{f}}} d t_{N}\left(F_{N}\left|N\left(t_{\mathrm{f}}, t_{N}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{N}\right)\right| \mathcal{M}_{N}\right) \\
& +\int_{t_{2}}^{t_{\mathrm{f}}} d t_{N+1}\left(F_{N}\left|U\left(t_{\mathrm{f}}, t_{N+1}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{N+1}\right)\right| \mathcal{M}_{N+1}\right) \\
& +\underbrace{[\cdots \mathcal{V}(t) \cdots]}+\mathcal{O}\left[\mathcal{V}(t)^{2}\right] \\
& {[- \text { It is too long to display. --] }}
\end{aligned}
$$

Expanding it in $\alpha_{s}$ then we have

$$
\begin{aligned}
\left(F_{N} \mid A_{\Delta}\right)= & \int_{N} d \sigma^{B}+\int_{N+1}\left[d \sigma^{R}-d \sigma^{A}\right] \\
& +\int_{N}\left[d \sigma^{S}[\mathcal{V}(t)]+d \sigma^{B} W_{\Delta}^{(1)}\right]+\mathcal{O}\left(\alpha_{s}^{2}\right)
\end{aligned}
$$

## Matching at NLO level

Fixing the shower formulae by subtracting the approximated and adding correct 1-loop contributions, thus we have

$$
\begin{aligned}
\left(F_{N} \mid A_{\Delta}^{\mathrm{NLO}}\left(t_{\mathrm{f}}\right)\right)= & \left(F_{N} \mid A_{\Delta}\left(t_{\mathrm{f}}\right)\right)-[\cdots \mathcal{V}(t) \cdots] \\
& +\int_{t_{2}}^{t_{\mathrm{f}}} d t_{N}\left(F_{N}\left|U\left(t_{\mathrm{f}}, t_{N}\right) W_{\Delta}\left(t_{\mathrm{f}}, t_{2} ; t_{N}\right)\right| \mathcal{M}_{N}^{(1)}\right)
\end{aligned}
$$

where

$$
\begin{aligned}
& \int\left[d\left\{s^{\prime}, c^{\prime}, s, c\right\}_{N}\right]\left(M_{N}^{(1)} \mid\{p, f, \ldots\}_{N}\right) \sim-\frac{\alpha_{s}}{2 \pi} W_{\Delta}^{(1)}\left|\mathcal{M}_{N}\right|^{2} \\
& \quad+\left|\mathcal{M}_{N}\right|^{2} \otimes\left(\boldsymbol{K}+\boldsymbol{P}\left(\mu_{F}\right)\right)+\left[\left|\mathcal{M}_{N}\right|_{1-l o o p}^{2}+\left|\mathcal{M}_{N}\right|^{2} \otimes \boldsymbol{I}(\epsilon)\right]_{\epsilon=0}
\end{aligned}
$$

## Conclusions

## The things I talked about:

- We defined a very general formalism to define and implement parton shower algorithm.
- We can consider spin correlation and color correlation beyond the leading color approximation.
- The treatment of the subleading color part is still perturbative (not exponentiated).
- The algorithm is capable to deal with the higher order corrections in $\alpha_{s}$ once the splitting kernels are known.
- We have general method to match the LO shower to Born and NLO matrix elements.

## Conclusion

## The things I didn't talk about:

- The algorithm is Lorentz covariant/invariant.
- Based on exact phase space.
- No technical cuts, parameters. Only the infrared cutoff parameter.
- Color coherence (angular ordering) is naturally provided without forced angular ordering, vetoing, or other tricks. No azimuthal averaging.
- The evolution parameter doesn't have to be special. Any infrared sensitive parameter is good. Use the simplest, say virtuality.
- Since we defined $\mathcal{H}_{I}^{\dagger}(t)$ operator, we defined a new NLO subtraction scheme for fix order NLO calculation.

## Conclusions

## About this new NLO scheme

- The algorithm is Lorentz covariant/invariant.
- Based on exact phase space factorization.
- Splitting operator is defined fully exclusive way. One can do MC helicity and color sum in the NLO calculation.
- For N -jet calculation the number of the subtraction terms is $(N+1)(N+4) / 2$. Compared to the Catani-Seymour dipole subtraction method $(N+1)^{2}(N+4) / 2$.
- Since we have less counter-terms we expect better numerical behavior.
