

Overview of the SUSY results from the ATLAS and CMS experiments

Janet Dietrich
on behalf of the ATLAS & CMS collaborations
Deutsches-Elektronen-Synchrotron

Epiphany 2014

Standard Model

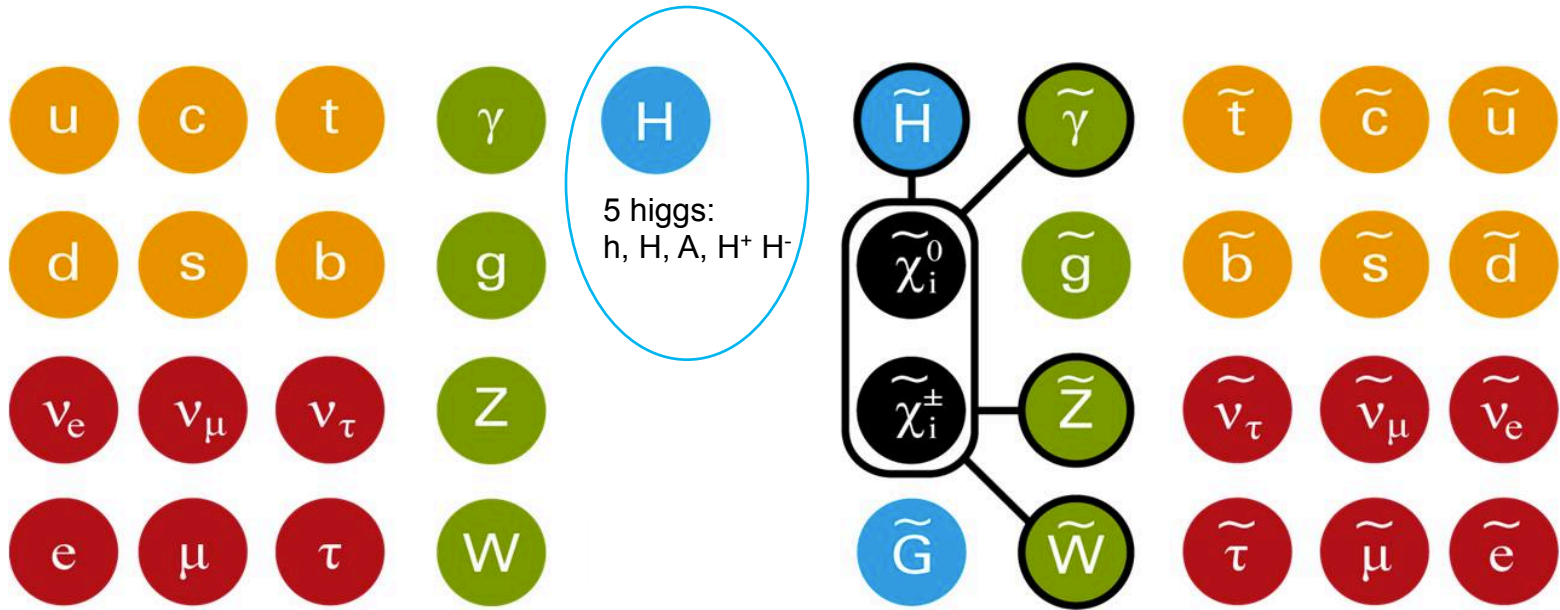

- Standard Model (SM) of elementary particles is a very successful theory
- precise predictions, verified by several experiments over many orders production rate
- discovery of the higgs boson completed the SM

What's the problem?

- no explanations of dark matter
- no explanation of the origin of matter-anti-matter asymmetry
- no unification of the forces
- high-levels of fine tuning needed to avoid quadratic divergences of higgs mass corrections
- ...

Supersymmetry (SUSY)

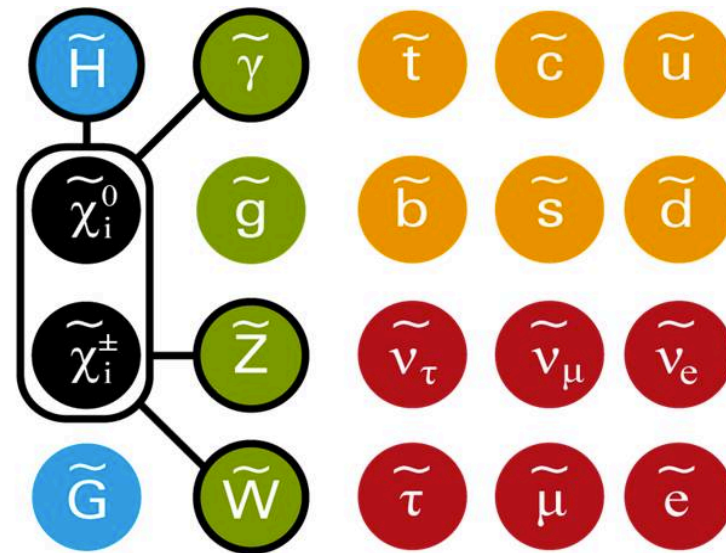

$$\begin{array}{l}
 \tilde{H}_u^0 \ \tilde{H}_d^0 \ \tilde{W}^0 \ \tilde{B}^0 \xrightarrow{\text{mixing}} \tilde{\chi}_1^0 \ \tilde{\chi}_2^0 \ \tilde{\chi}_3^0 \ \tilde{\chi}_4^0 \quad \text{neutralinos} \\
 \tilde{H}_u^+ \ \tilde{H}_d^- \ \tilde{W}^+ \ \tilde{W}^- \xrightarrow{\text{mixing}} \tilde{\chi}_1^\pm \ \tilde{\chi}_2^\pm \quad \text{charginos}
 \end{array}$$

- extension of the Standard Model: introduction of a new symmetry
- relating spin 1/2 matter particles (fermions) ⇔ spin 1 particles (bosons)
- SUSY partners are heavier than SM partners → broken symmetry
- solves hierarchy (and other) problems of the SM

Supersymmetry (SUSY)

- solves hierarchy problems of the SM

→ stabilises the higgs mass from quadratically divergent loop corrections

*superpartner loop
cancel SM loop*

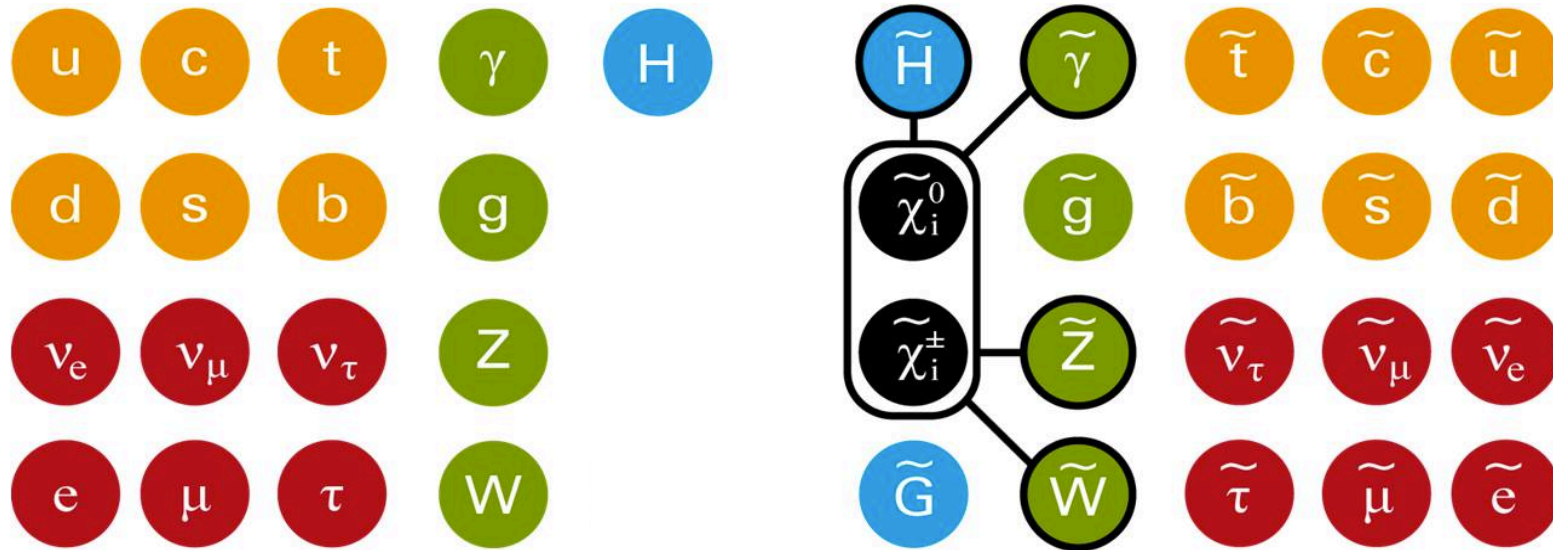

Supersymmetry (SUSY)

- provides possibility of unification of the EW and QCD coupling constants

Supersymmetry (SUSY)

- new quantum number: R-parity $R = (-1)^{B+L+2S} = +1$ (-1) SM (SUSY) particles
- if R-parity is conserved, lightest SUSY particles (LSP) is stable
- in many SUSY models, LSP is commonly lightest neutralino $\tilde{\chi}_1^0$
 → dark matter candidate

Supersymmetry (SUSY)

For the past ~30 years SUSY has been supposed to be “just around the corner”, but no observation yet.

How do we search for SUSY at the LHC?

-
-
- in many SUSY models, LSP is commonly lightest neutralino $\tilde{\chi}_1^0$

→ dark matter candidate

Searching for Supersymmetry

How to search for SUSY ?

- ✓ focus on the process of interest

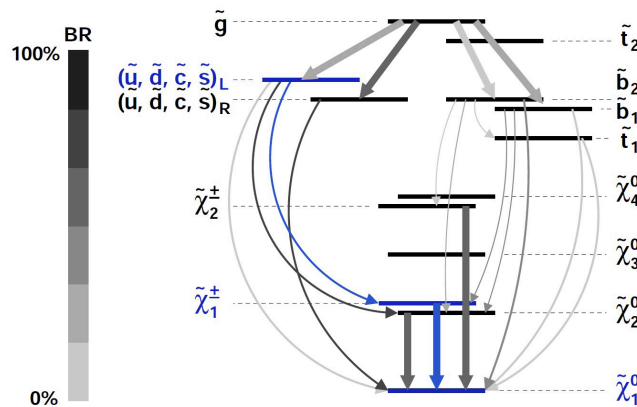

squarks decay into chargino \rightarrow neutralino

Searching for Supersymmetry

How to search for SUSY ?

- ✓ focus on the process of interest
- ✓ study a specific decay chain using simplified models
 - simple and broad approach for SUSY searches
 - small number of sparticles
 - assumed BR usually 100%
 - decay described by masses and cross sections

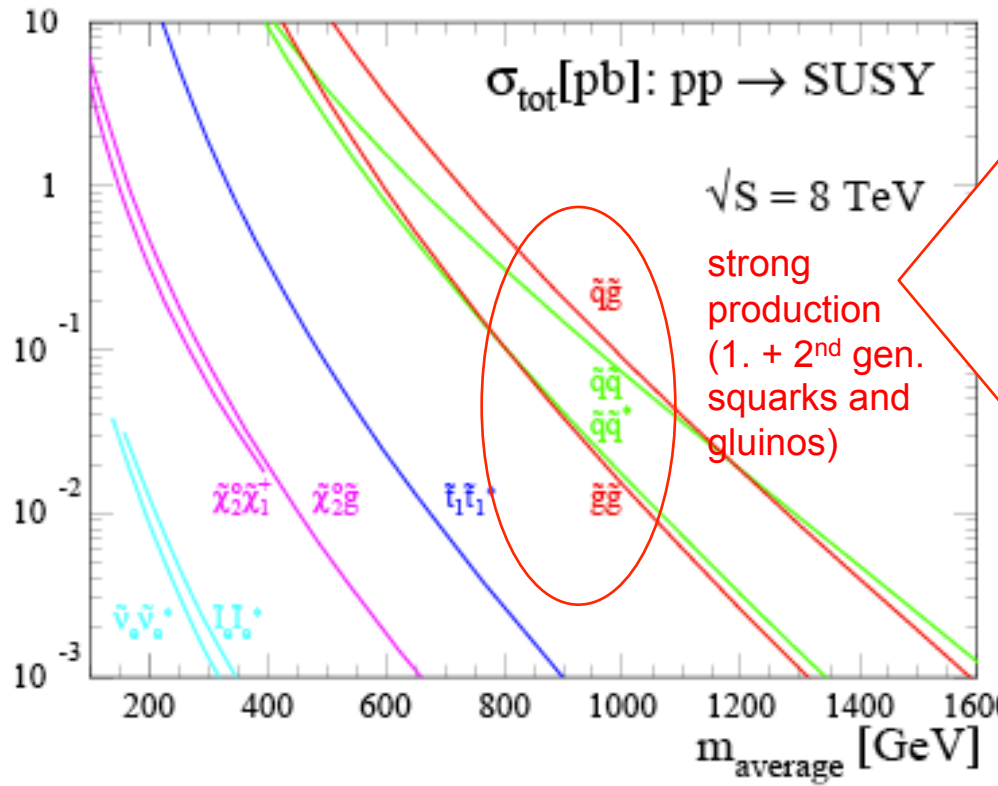

Search strategy

Where do we start?

SUSY search strategy is driven by the cross-section and luminosity

Search strategy

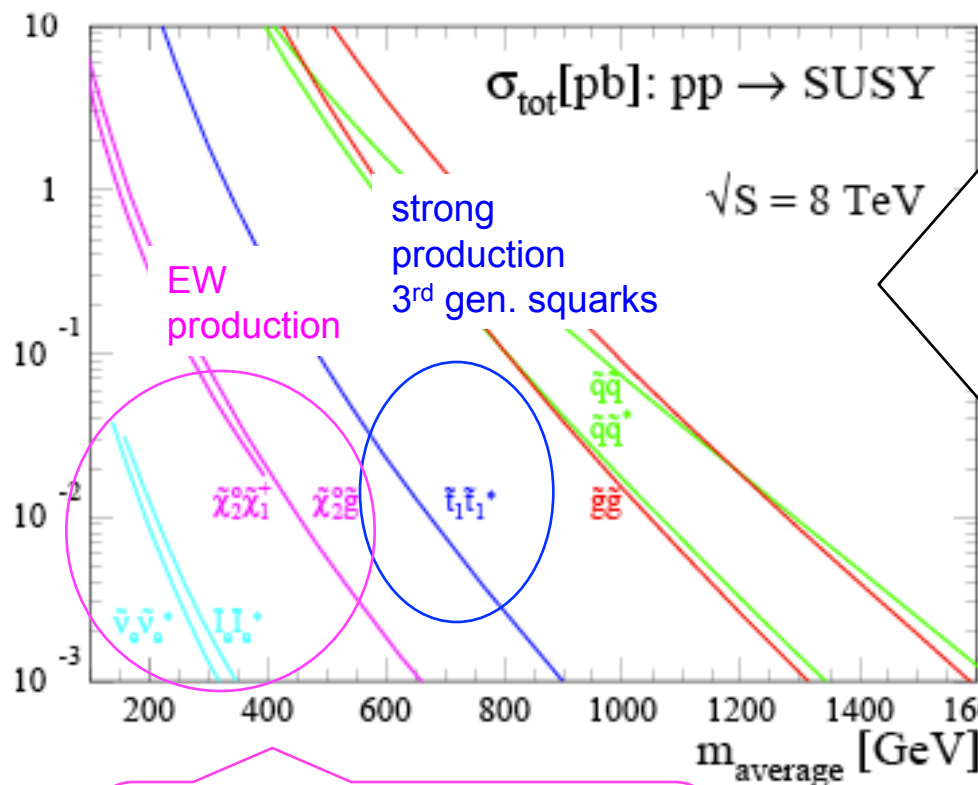

- early analyses:
 - dominated by inclusive searches for strongly produced SUSY particles (gluino and squarks) due to high production cross sections
- many SUSY models e.g. MSUGRA/CMSSM dominated by strong production
- final states depend on the decays of squark/gluino: jet + E_T^{miss} + leptons

Search strategy

With increasing luminosity: access to rare production channels

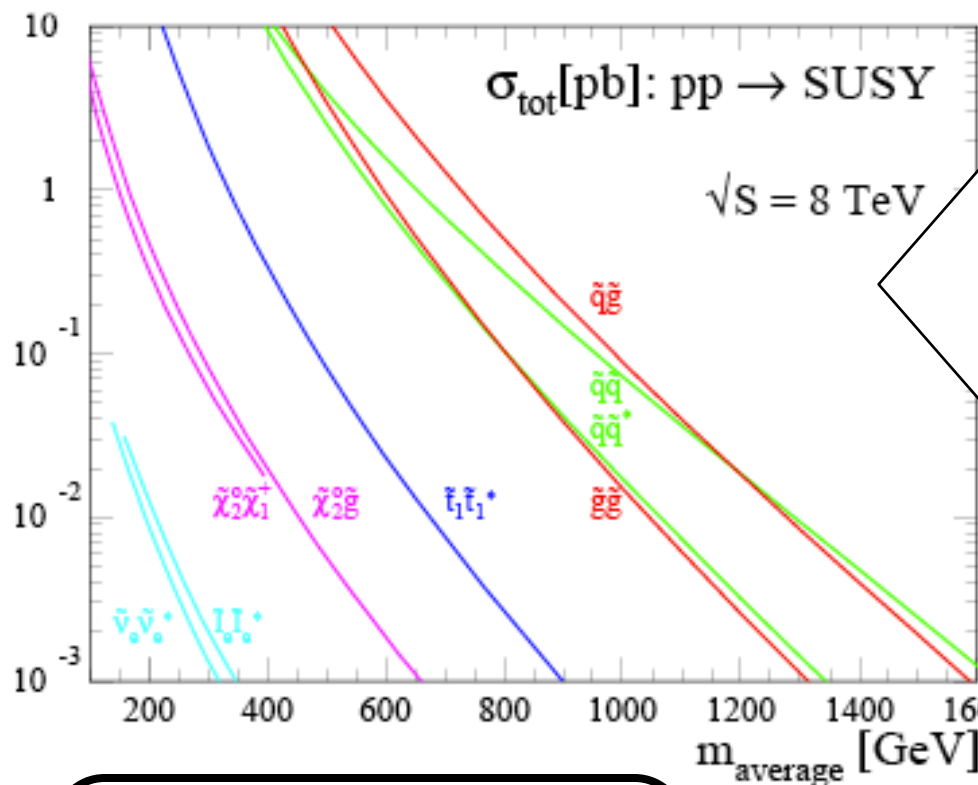

- smaller cross sections
- motivation from natural SUSY:
 - light stops ($m < 1 \text{ TeV}$)
 - light higgsinos
 - gluinos $m < 1.5\text{-}2 \text{ TeV}$
 - charginos, neutralinos of few hundreds GeV
- final states: (b)-jet + E_T^{miss} + leptons

if colored SUSY particles are too heavy, electroweak production can be dominant SUSY production mechanism at the LHC

Search strategy

With increasing luminosity: access to rare production channels

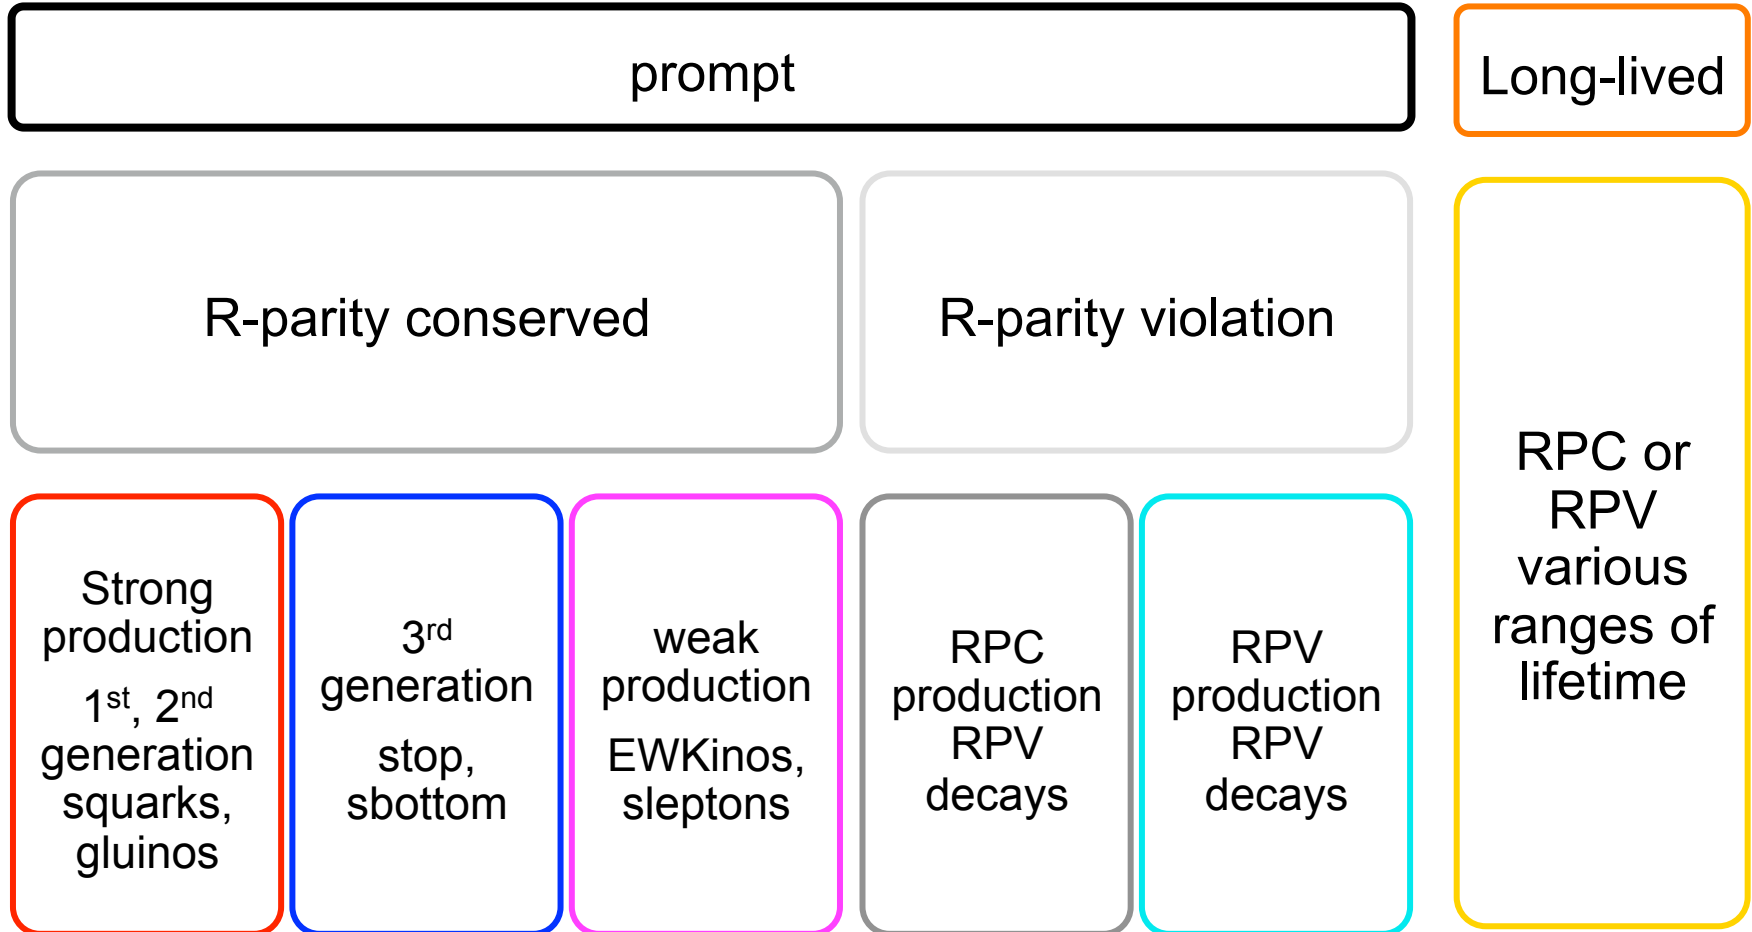

- smaller cross sections
- motivation from natural SUSY:
 - light stops ($m < 1 \text{ TeV}$)
 - light higgsinos
 - gluinos $m < 1.5\text{-}2 \text{ TeV}$
 - charginos, neutralinos of few hundreds GeV
- final states: (b)-jet + $E_{\text{T}}^{\text{miss}}$ + leptons

also addressed:
 experimentally challenging
 searches such as long-lived
 particles and R-parity
 violating (RPV) scenarios

Search strategy

- search strategy designed to cover this broad spectra of different SUSY models
- for every search: signal regions are optimized individually based on the variety of the models/decay chains

Search strategy

- search strategy designed to cover this broad spectra of different SUSY models
- for every search: signal regions are optimized individually based on the variety of the models/decay chains

I will only discuss the latest results using full 2012 data (20fb^{-1}), but unfortunately I am not able to cover all searches CMS and ATLAS have performed in the quest for SUSY!

You can find a summary of all SUSY results + links to the analysis under:

<https://twiki.cern.ch/twiki/bin/view/CMSPublic/PhysicsResultsSUS>

<https://twiki.cern.ch/twiki/bin/view/AtlasPublicSupersymmetryPublicResults>

squarks,
gluinos

sbottom

sleptons

decays

decays

1st and 2nd generation squark and gluino production

Squark-gluino searches

squark/gluino production with neutralino LSP

squark/gluino production with gravitino LSP

- very high cross sections for strongly produced SUSY particles at the LHC
→ large yield even in small datasets
- interpreted within many different SUSY models: constrained models (mSUGRA/CMSSM, GMSB, pMSSM, mUED), simplified models

ATLAS searches

0-leptons + 2-6 jets + E_T^{miss}	ATLAS-CONF-2013-047
0-leptons + 7-10 jets + E_T^{miss}	arxiv 1308.1841
1-2-leptons + 3-6 jets + E_T^{miss}	ATLAS-CONF-2013-062
2-leptons + 2-6 jets + E_T^{miss} (Razor)	ATLAS-CONF-2013-089
2-leptons SS + 0-3 b-jets + E_T^{miss}	ATLAS-CONF-2013-007
1-2 taus + jets + E_T^{miss}	ATLAS-CONF-2013-026

CMS searches

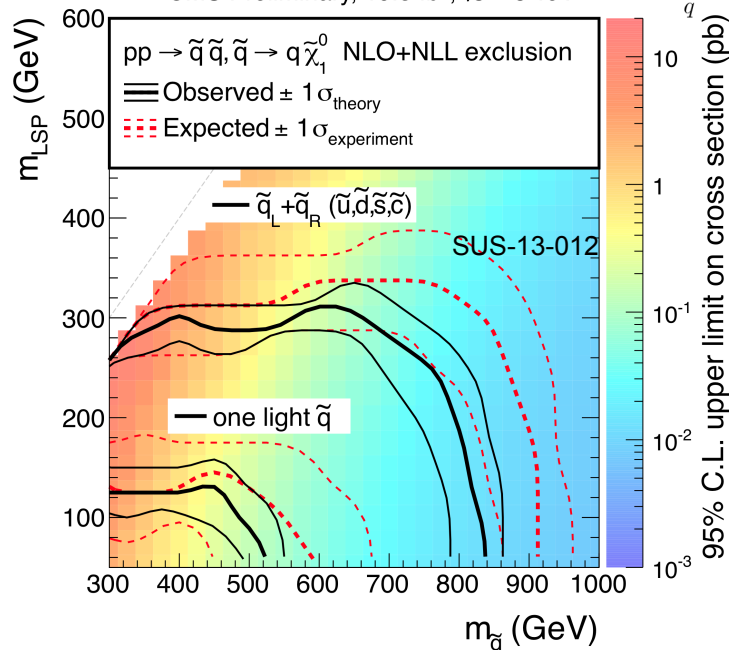

2-3, ≥ 4 jets + 0, 1, 2, 3, ≥ 4 b-jets + E_T^{miss} (α_T)	SUS-12-028
3-5, 6-7, ≥ 8 jets + E_T^{miss}	SUS-13-012

Squark-gluino searches

squark production

CMS Preliminary, 19.5 fb⁻¹, $\sqrt{s} = 8$ TeV

gluino production

CMS Preliminary, 19.5 fb⁻¹, $\sqrt{s} = 8$ TeV

- assume 100% BR for the stated process in the simplified model grids
- weaker limits with reduced number of squarks kinematically available e.g. (u_L, u_R): $m(\text{light squark}) < 500$ GeV
- limits for massless LSP: $m(\text{squark}) < 850$ GeV, $m(\text{gluino}) < 1.2$ TeV
- computed excluded cross section for each model in parameter space

Squark-gluino searches: mSUGRA – pMSSM models

mSUGRA/CMSSM grid

higgs-aware:
 accommodates a lightest neutral scalar Higgs boson mass of 125 GeV

pMSSM grid

simplified pMSSM scenarios with only strong production of gluinos and first- and second-generation squarks (of common mass)

Squark-gluino searches: mSUGRA models

mSUGRA/CMSSM: $\tan(\beta) = 30, A_0 = -2m_0, \mu > 0$

Status: SUSY 2013

0-lepton + 2-6 jets analysis
strongest at low m_0 , high $m_{1/2}$
→ dominated squark-squark
production

≈ 1.35 TeV gluinos
excluded for any
squark mass

0-lepton + 3 b-jets analysis
strongest at low $m_{1/2}$, high m_0
→ mostly $\tilde{g} \rightarrow \tilde{t}/\tilde{b}$

Squark-gluino searches: pMSSM models

three models with different LSP mass are considered:

- $m(\tilde{\chi}_1^0) = 0$ GeV
- $m(\tilde{\chi}_1^0) = 395$ GeV
- $m(\tilde{\chi}_1^0) = 695$ GeV

ATLAS-CONF-2013-047

SR 4 jet

≥ 4 jets, $E_T^{\text{miss}} > 160$ GeV,

$M_{\text{eff}} = \sum p_T(\text{jets}) + E_T^{\text{miss}} > 1.2$ (2.2) TeV

lines show best limits from the 10 SRs

3rd generation squark production

Natural SUSY searches – gluino mediated stops/sbottoms

gluino decay via off-shell stop/sbottom

gluino decays into LSP + top/bottom quarks

- targeting natural SUSY spectra with light stops and sbottoms
- light gluino can be produced in pairs and decay through (on-shell or off-shell) stops/ sbottoms
- better controlled SM backgrounds via b-tagging and special topology signatures (e.g. many jets) provide higher sensitivity

ATLAS searches

0-leptons + 7- \geq 10 jets + E_T^{miss}	ATLAS-CONF-2013-054
0-1-lepton + \geq 3 b-jets + E_T^{miss}	ATLAS-CONF-2013-061
2-leptons SS + 0-3 b-jets + E_T^{miss}	ATLAS-CONF-2013-007

CMS searches

0 - 1 -lepton+ b-jets + E_T^{miss} (Razor)	SUS-13-004
3-5, 6-7, \geq 8jets + E_T^{miss} (H_T)	SUS-12-024
1-lepton + b-jets + 2-3, \geq 4 jets+ E_T^{miss}	SUS-13-007
3-lepton + b-jets + E_T^{miss}	SUS-13-008
2-leptons SS + b-jets + E_T^{miss}	SUS-13-013
2-leptons OS + b-jets + E_T^{miss}	SUS-13-016

Glino mediated sbottom-stop production

no exclusion for $m(\text{LSP}) > 750 \text{ GeV}$
 strongest limit: gluino masses $< 1375 \text{ GeV}$
 for massless LSP

no exclusion for $m(\text{LSP}) > 700 \text{ GeV}$
 strongest limit: gluino masses $< 1400 \text{ GeV}$
 for massless LSP

3rd generation direct production

- large spectrum of possible stops and sbottoms decays
- sensitivity is dependent on sparticle mass differences and decay channels: final states include (b)-jets, E_T^{miss} and (often) leptons
- effort so far: concentrated on simplified models with 100% BRs to chosen final state

ATLAS searches

0-leptons + 2 b-jets+ E_T^{miss} arXiv:1308.2631
 0-leptons + ≥ 3 b-jets+ E_T^{miss} ATLAS-CONF-2013-061
 1-leptons + 4 (2 b-) jets+ E_T^{miss}
 ATLAS-CONF-2013-037
 2-leptons (SS) + 3 (1 b-) jets+ E_T^{miss}
 ATLAS-CONF-2013-007

0-lepton + 6 (2 b-) jets+ E_T^{miss} ATLAS-CONF-2013-024
 0-lep. + charm/ mono-jet+ E_T^{miss}
 ATLAS-CONF-2013-068
 2-leptons + (1, 2) b-jets+ E_T^{miss}
 ATLAS-CONF-2013-048/065
 Z(ll) + b-jets+ jets+ E_T^{miss} ATLAS-CONF-2013-025

CMS searches

2-lepton (SS) + (b-) jets+ E_T^{miss} SUS-13-013

0 - 1 -lepton+ b-jets + E_T^{miss} (Razor) SUS-13-004
 1-lepton 4 (1 b-) jets+ E_T^{miss} SUS-13-011

Stop 2 decays via higgs:
 1-2 lepton + ≥ 4 -5 (3- ≥ 4 b-) jets SUS-13-014

sbottom searches
 stop searches

3rd generation direct production – sbottom searches

$$\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$$

arXiv:1308.2631

$$\tilde{b}_1 \rightarrow t\tilde{\chi}_1^\pm$$

SUS-13-013

$$\tilde{b}_1 \rightarrow b\tilde{\chi}_2^0 \rightarrow bh(bb)\tilde{\chi}_1^0$$

ATLAS-CONF-2013-061

- exclusion regions depend on decay chain and mass splitting e.g. between chargino – LSP
- for massless LSP: sbottoms up to 650 GeV are excluded
- best limits for LSP ~270 GeV

3rd generation direct production – stop searches

- multiple searches possible targeting different stop/chargino/neutralino mass hierarchies and decay scenarios
- decays depend on the stop mass and sparticle mass differences
- searches focus on simplified models with 100% BR on final state

* LEP: chargino mass limit at about 100 GeV

3rd generation direct production – stop searches

stop masses up to 740 GeV for massless LSP are excluded assuming 100% BR
best limit for LSP < 250 GeV

$\tilde{t}\tilde{t}$ production

1-lepton analysis

0 + 1 lepton
Razor analysis

$$\tilde{t}_1 \rightarrow t \tilde{\chi}_1^0$$

3rd generation direct production – stop searches

limits depend on chargino mass

$$\tilde{t}_1 \rightarrow b \tilde{\chi}_1^\pm$$

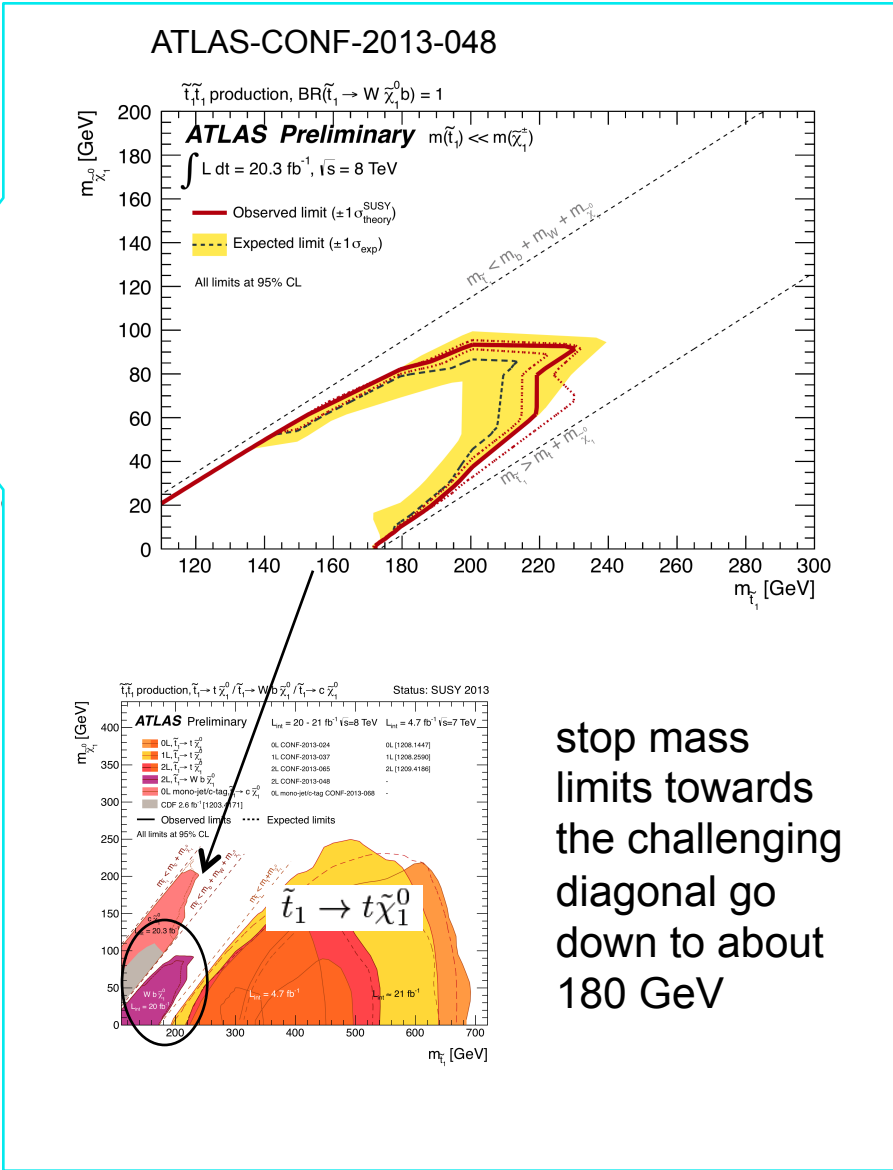

nearly mass-degenerated chargino, neutralino

chargino mass = 2x neutralino mass

3rd generation direct production – stop searches

3rd generation direct production – stop searches

stop mass limits towards the challenging diagonal go down to about 180 GeV

3rd generation direct production – stop searches

ATLAS-CONF-2013-068

2 analyses targeting different Δm :

- mono-jet analysis (small Δm)
- charm-tagged analysis (with leading jet from ISR)

best limits:

$m(\text{stops}) < 230 \text{ GeV}$

$m(\text{stops}) < 200 \text{ GeV}$

(without limits on LSP mass)

electroweak SUSY production

Electroweak SUSY production

- may dominate if squarks/gluinos are heavy and neutralinos/charginos are light
- electroweak SUSY particle production ($\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$, $\tilde{\chi}_1^0 \tilde{\chi}_2^0$, $\tilde{\ell} \tilde{\ell} \dots$)
- occurs via intermediate W, Drell-Yan processes or intermediate sleptons
- search strategy depends on the slepton masses, gauge mixture and masses of charginos/neutralinos
- characteristic: multi-lepton signatures with low hadronic activity \rightarrow low SM background

ATLAS searches

2-leptons (e, μ) + E_T^{miss}	ATLAS-CONF-2013-049
3-leptons (e, μ) + E_T^{miss}	ATLAS-CONF-2013-035
≥ 4 -leptons + E_T^{miss}	ATLAS-CONF-2013-036
≥ 2 -taus + E_T^{miss}	ATLAS-CONF-2013-028

WH (bb):

1-lepton + 2 b-jets (H) + E_T^{miss}	ATLAS-CONF-2013-093
---	---------------------

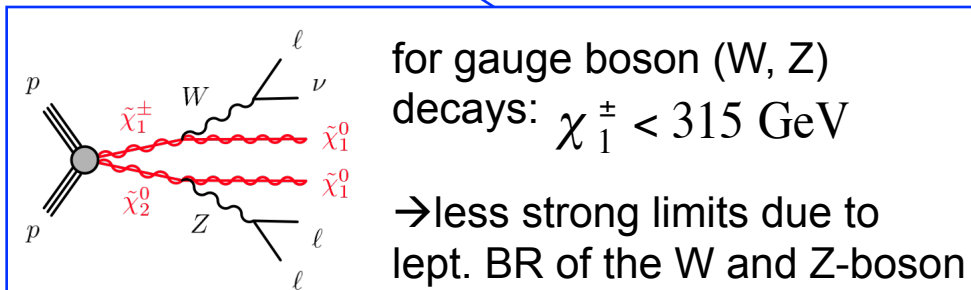

CMS searches

2-lepton + E_T^{miss}	SUS-13-006
3-lepton + SS di-lepton + E_T^{miss}	SUS-13-006
3-lepton (e, μ) + E_T^{miss}	SUS-13-006
2-lepton + 2 jet + E_T^{miss}	SUS-13-006

WH(bb, WW, ZZ, $\tau\tau$):

1-lepton + 2 b-jets + E_T^{miss}	SUS-13-017
2-lepton SS + 2 -3-jets + E_T^{miss}	SUS-13-017
3-lepton + 2 b-jets + E_T^{miss}	SUS-13-017

EW SUSY production – chargino-neutralino scenario

distribution after the dilepton mass requirement
 $81 \text{ GeV} < m(\text{ll}) < 101 \text{ GeV}$

EW SUSY production: Higgs final states

if sleptons are heavy:
 decays via bosons are favored
 → decay may include the production of Higgs

best limit for Wh decay: $\chi_1^\pm < 300 \text{ GeV}$

EW SUSY production GMSB and slepton scenario

GMSB Z enriched higgsino scenario

limit set using Z+dijet + 4-lept. analyses:
mass parameter $\mu < 370$ GeV

slepton production

limit set using 2-lep. OS analyses:

$$90 \text{ GeV} < \tilde{l}_{RL} < 320 \text{ GeV} \quad \tilde{l}_R < 230 \text{ GeV}$$

Long lived particles (LLP) and R-parity violation

ATLAS and CMS look at different RPV and long-lived signatures in different channels trying to cover a wide range of lifetimes e.g. disappearing tracks, R-hadrons, displaced vertex,...

- massive long-lived particles can originate from:
- ✓ mass degeneracy e.g. small chargino-neutralino mass difference
- ✓ heavy mediator sparticles e.g. Split SUSY (suppressed gluino decay)
- ✓ R-parity violating terms (weak couplings)

ATLAS searches

prompt RPV

- 0 lep. + ≥ 7 (0-2 b-) jets + E_T^{miss} ATLAS-CONF-2013-091
- 0 lep. + $\geq 6-10$ (0-2 b-) jets + E_T^{miss} arXiv 1308.1841
- 4 lep. + E_T^{miss} ATLAS-CONF-2013-036
- heavy resonances to $e\mu, \mu\tau, e\tau$ PLB 723 (2013) 15

Long-lived

- disappearing tracks (long-lived charginos) arXiv: 1310.3675
- stopped gluinos or squark R-hadrons (27.9 fb^{-1}) arXiv: 1310.6584
- long-lived sleptons e.g. GMSB ATLAS-CONF-2013-058
- displaced vertex ATLAS-CONF-2013-092
- non-pointing photons (7 TeV) PRD 88, 012001

CMS searches

- 1 lepton + 6-8 (1-5 b-) jets + E_T^{miss} SUS -12-015
- 4 lep. + E_T^{miss} SUS -13-010
- 3-4 leptons + b-jet+ E_T^{miss} arXiv: 1306.6643
- 2-leptons SS + b-jets + E_T^{miss} SUS-13-013
- ≥ 3 leptons + b-jet + E_T^{miss} SUS-12-027

Long lived particles (LLP)

disappearing track

AMSB model where chargino mass is nearly degenerate with LSP mass

Phys. Rev. D 88, 112006

long-lived gluino R-hadrons

R-hadrons (e.g. in Split-SUSY) can stick in the detector and decay later

use empty LHC bunches to search for hadronic calorimeter activities

Phys. Rev. D 88, 112003

displaced vertex

search for heavy particles with multi-track, high mass vertex containing high p_T muons

ATLAS-CONF-2013-092

Long lived particles (LLP)

disappearing track

AMSB model with
 $\Delta m \sim 160 \text{ MeV}$ limits:

$$\tau \sim 0.2 \text{ ns}: \chi_{1^\pm} < 270 \text{ GeV}$$

$$\tau \sim 1-10 \text{ ns}: \chi_{1^\pm} < 520 \text{ GeV}$$

long-lived gluino R-hadrons

limits:
 LSP = 100 GeV,
 $m(\text{gluino}) < 832 \text{ GeV}$
 $\tau = 10^{-5} \text{ s} - 10^3 \text{ s}$
 $m(\text{stop}) < 379 \text{ GeV}$
 $m(\text{sbottom}) < 344 \text{ GeV}$

displaced vertex

limits:
 1 TeV squarks excluded for
 $1.5 \text{ mm} < c\tau < 156 \text{ mm}$
 100% BR for decays to
 108 GeV LSP

R-parity violation (RPV)

RPV can allow LSP to decay into three quarks

→ final states with many jets

ATLAS-CONF-2013-091

arXiv: 1308.1841
JHEP 10 (2013) 130

if higgsino/gauginos are light
→ stops decay can proceed via superpartners

arXiv: 1306.6643

limits:

BR (heavy quarks) = 0%
→ $m(\text{gluino}) < 900 \text{ GeV}$
BR (top) = 100 %
→ $m(\text{gluino}) < 800 \text{ GeV}$

limits:

gluinos $< 900 \text{ GeV}$ are excluded independent of stop mass

limits:

stops are excluded up to 1 TeV

Conclusions

- ATLAS and CMS have developed a broad SUSY program
- detailed and thorough searches, covered wide ranges of signatures
- main focus on strong production, natural SUSY, RPV and long-lived SUSY searches
- effort to cover maximum area of the SUSY parameter space
 - use simplified models, pheno models and full models
- no sign of SUSY found yet, but
 - ... we will start with LHC run 2 soon!
- high energy running will significantly increase our sensitivity to many SUSY scenarios

Looking forward to next exciting years!

Thank you for your attention!

*Only a selection of the available mass limits on new states or phenomena is shown. All limits quoted are observed minus 1 σ theoretical signal cross section uncertainty.

Summary of exclusion limits of CMS SUSY searches

Summary of CMS SUSY Results* in SMS framework SUSY 2013

*Observed limits, theory uncertainties not included
 Only a selection of available mass limits
 Probe *up to* the quoted mass limit

Summary of exclusion limits of CMS SUSY searches

Summary of CMS RPV SUSY Results*

EPSHEP 2013

*Observed limits, theory uncertainties not included
 Only a selection of available mass limits
 Probe *up to* the quoted mass limit

Conclusions

- 95% CL exclusion limits are set on various models:

$\tilde{q} \rightarrow q\chi_1^0$	850 GeV (500 GeV)
$\tilde{g} \rightarrow q\bar{q}\chi_1^0$	1200 GeV
$\tilde{g} \rightarrow b\bar{b}\chi_1^0$	1375 GeV
$\tilde{g} \rightarrow t\bar{t}\chi_1^0$	1400 GeV
$\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0$	750 GeV
$\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$	650 GeV
$\tilde{l}_\pm \rightarrow l^\pm\chi_1^0$	320 GeV

Outlook

What is next?

- increase sensitivity to difficult SUSY scenarios
- explore new channels, probe more parameter space
- prepare for $\sqrt{s} = 13$ TeV, LHC run-2 in 2016/2017

C. Potter, LHC Seminar,
October 2013

ATL-PHYS-2013-011

- high-energy LHC run will significantly increase the sensitivity to many SUSY scenarios e.g. expect factor ~ 10 for 600 GeV stops and factor ~ 2 for 2 TeV gluinos

→ improvement for 300 fb^{-1} and 3000 fb^{-1} at $\sqrt{s} = 14 \text{ TeV}$

SUSY limits

3rd generation direct production

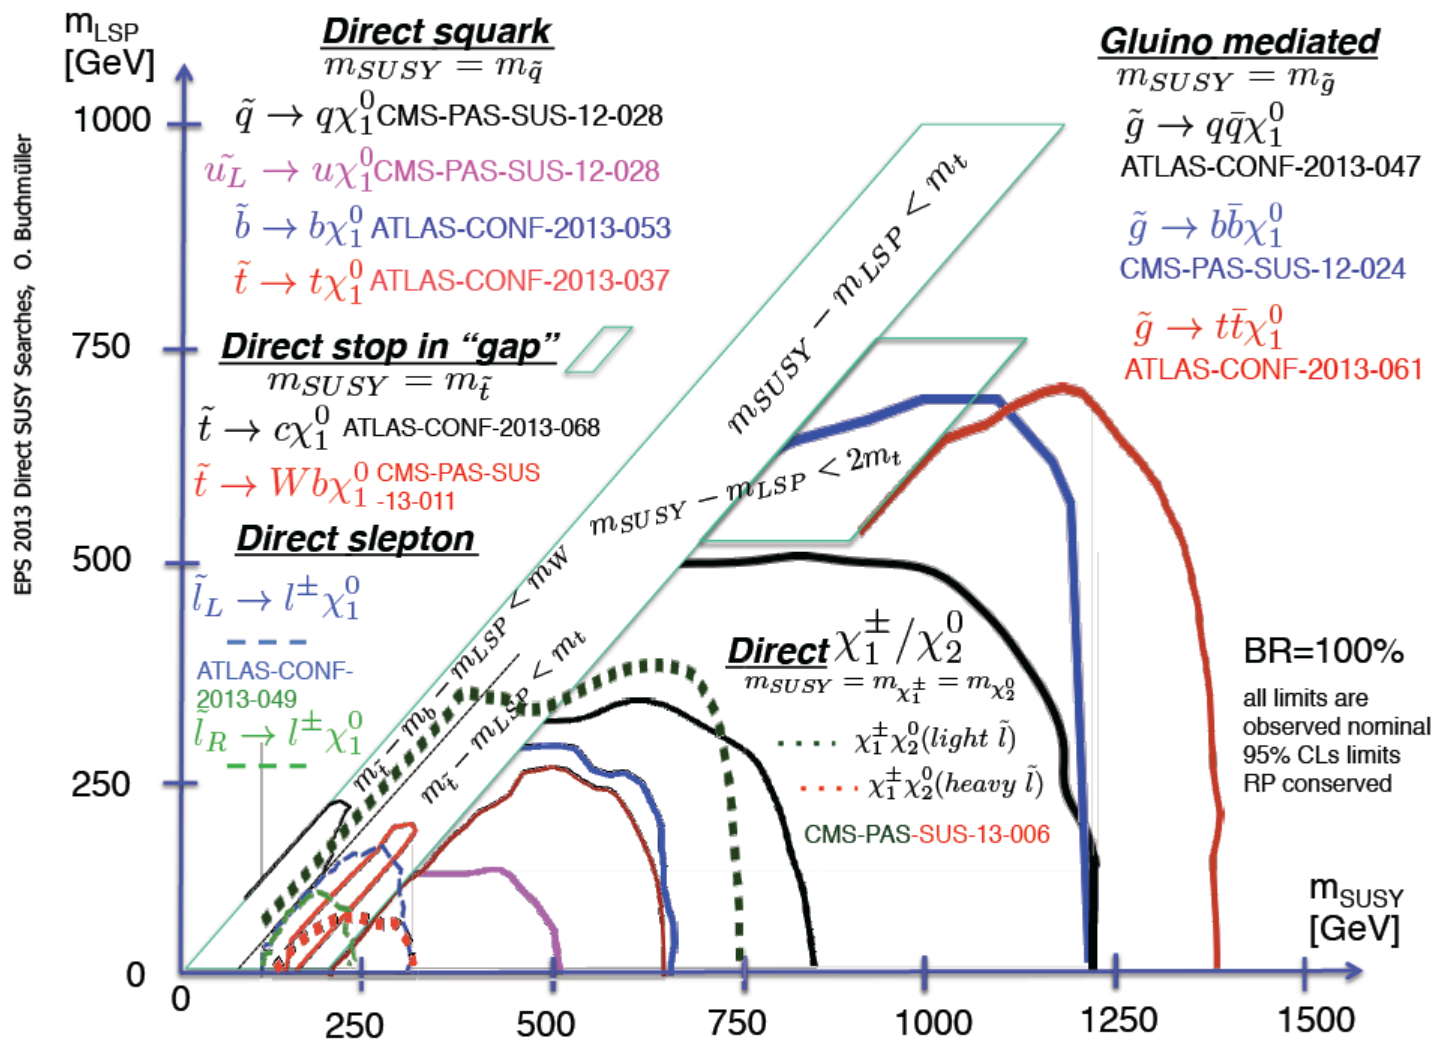

3rd generation direct production

Conclusions

Thank you for your attention!

EPS 2013 Direct SUSY Searches, O. Buchmüller

ATLAS detector

3-level trigger

Rate 40 MHz \rightarrow \sim 400 Hz

44m long
25m diameter

Inner Detector

Silicon pixels & strips + TRT straws

Precise tracking and vertexing, electron/pion separation

p resolution $\sigma/p_T \sim 3.8 \times 10^{-4} p_T$ (GeV) \oplus 0.015

ECAL

Pb-LAr accordion

Electron/photon id & measurement

E resolution $\sigma/E \sim 10\%/\sqrt{E}$

Muon Spectrometer

Air-core toroids with gas-based muon chambers

Muon measurement

p resolution $\sigma/p < 10\%$ up to $p \sim 1$ TeV

HCAL

Fe/scintillator tiles (central), Cu/Q-LAr (fwd)

Measurement of jets & missing E_T

E resolution $\sigma/E \sim 50\%/\sqrt{E} \oplus 0.03$

Experimental setup: Luminosity and pileup

~ 22 fb⁻¹ collected at $\sqrt{s} = 8$ TeV
~ 5 fb⁻¹ collected at $\sqrt{s} = 7$ TeV

with ~ 90% of the delivered data
being good for physics

Most results presented here use
the full 8 TeV dataset

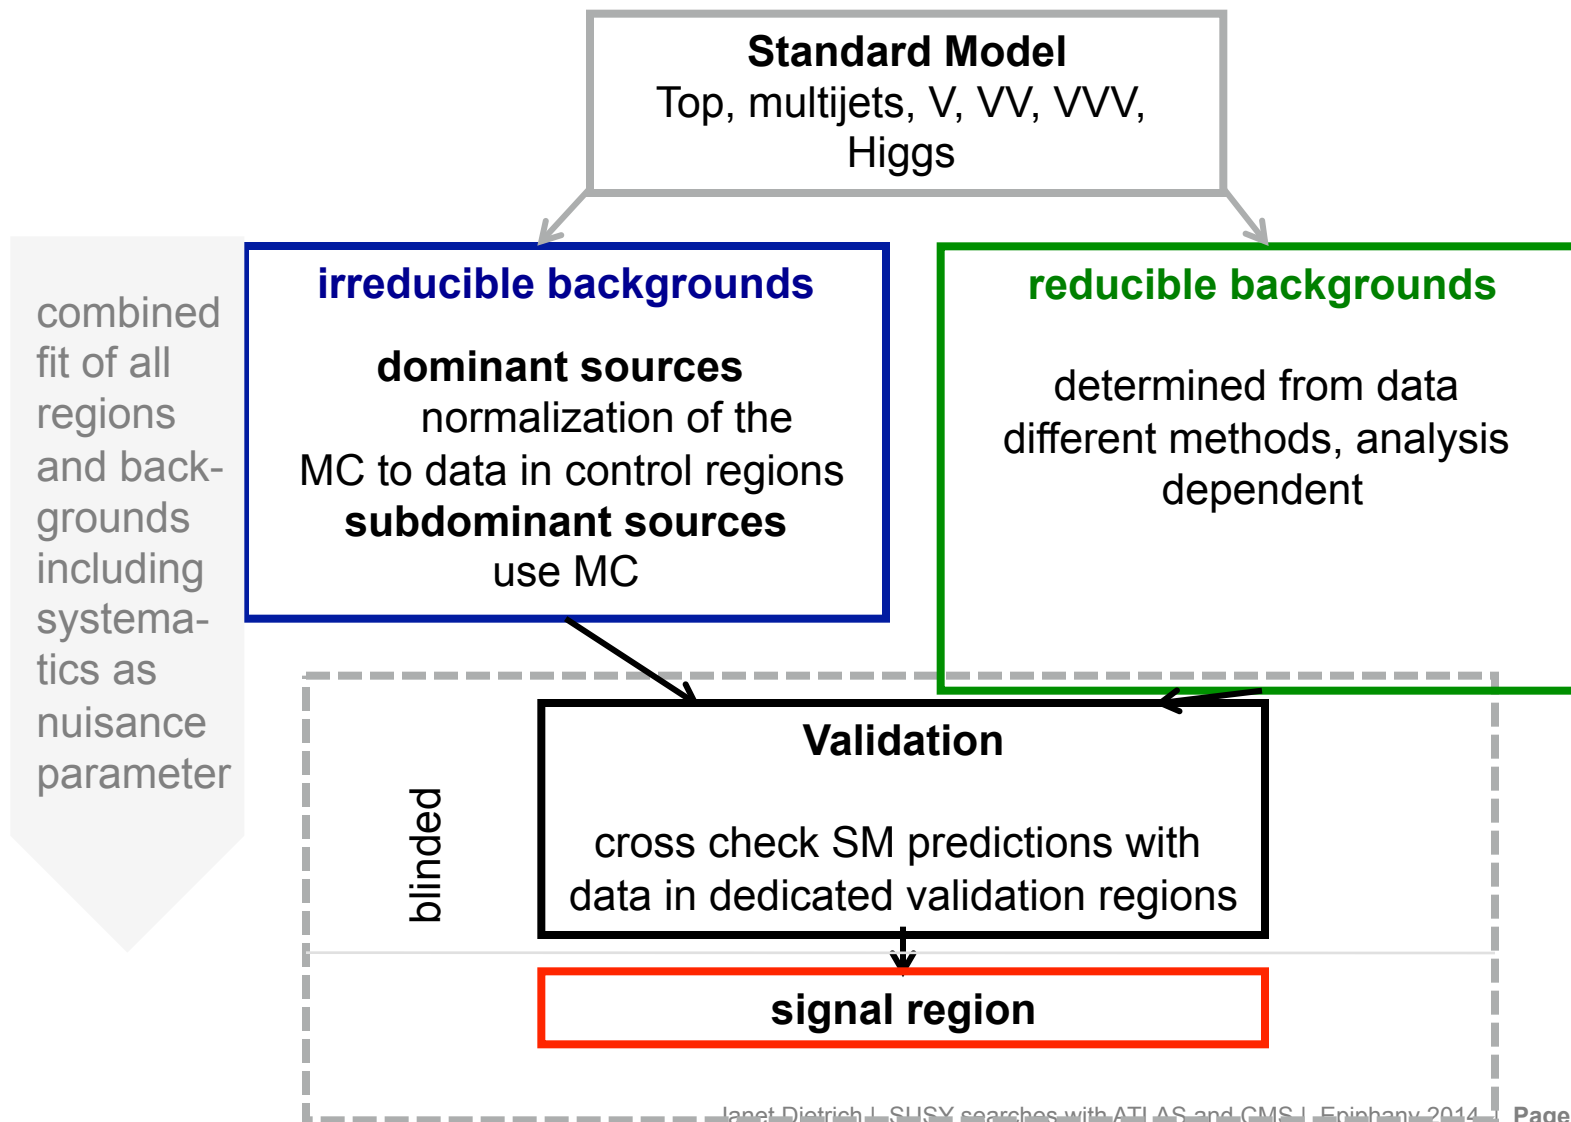

Large luminosity results in large pileup
(number of interactions per bunch
crossing)

Pileup suppression strategies have
been carefully developed

Background

- understanding and modeling of the SM background is important for every SUSY search

Systematic uncertainties

- *MC statistics*: statistical uncertainties from the limited number of simulated events in the SRs and CRs
- *JET*: propagation of the jet energy scale calibration (JES) and resolution (JER) uncertainties; JES uncertainties do propagate to E_T^{miss}
- *LEPTON*: lepton reconstruction, identification and trigger efficiencies, energy and momentum measurements; lepton energy scale uncertainties propagate to E_T^{miss}
- *B-tagging*: uncertainties on the b-jet identification efficiency and charm and light-flavor jet rejection factors
- *Luminosity*: 2.8 % derived from a preliminary calibration of the luminosity scale from beam-separation scans
- *Soft term*: additional uncertainties on E_T^{miss} associated with the energy deposits not assigned to any object
- *Theory*: generator modeling uncertainties obtained by comparing results from different MC generators, parton shower modeling (PS), initial and final state radiation (ISR/FSR)
- *Signal*: taken from an envelope of cross-section predictions using different PDF sets and factorization and normalization scales

Flavor tagging

■ b-tagging

Advanced algorithm based on multivariate technique.

- **MV1**: a Neural Network based tagger that combines information from transverse and longitudinal impact parameter (IP) significance, secondary vertex, geometry of decay chain.
- efficiency: 70% with 0.7% light flavour and 20% charm jets.

■ c-tagging

Using multivariate techniques to combine information from impact parameters of displaced vertices within the jet.

Operating points:

- **Medium**
 - 20% c-tagging efficiency
 - Rejection factors: 5 b-jets, 140 light-jets, 10 tau-jets
- **Loose**
 - 95% c-tagging efficiency
 - Rejection factors: 2 b-jets

■ Hadronically decaying tau reconstruction

- **Reconstruction**: seeded by baseline jets
- **Track associated**: core and isolation tracks
- Information from tracking and calorimeters combined to derive **identification variables**
- **Four-momentum** from clusters in core cone + TES correction

Squark-gluino production pMSSM grid

- - Expected limit
- Yellow band $\pm 1\sigma$ experimental uncertainties
- Red line: Observed limit
- - Dashed lines $\pm 1\sigma$ signal theory uncertainties

Signal uncertainties considered

In yellow band

- Experimental uncertainties
- ISR uncertainty on signal MC
- Up to 30% in some regions with small Δm

In red dashed lines

- Cross-section uncertainties (PDF, renormalisation/factorization scales)

SUSY limits

- compute the 95% CL model independent limits on $\sigma_{\text{vis}} = \sigma \times A \times \epsilon$
- compute 95% CL model dependent exclusion curves on σ_{SUSY} and sparticle masses

- expected limits
- - - $\pm 1\sigma$ experimental uncertainties + ISR uncertainties on signal MC
- observed limits
- - - $\pm 1\sigma$ signal theory uncertainties (xsection uncertainties, PDF, renormalisation/factorisation scales)

best limits:

LSP mass ≈ 450 GeV
 gluino mass ≈ 1200 GeV

How to search for SUSY?

SUSY variables

scalar sum of all jets p_T + scalar sum of all leptons p_T

$$H_T = \sum p_{T,jets} + \sum p_{T,leptons}$$

effective mass

$$M_{\text{eff}} = H_T + E_T^{\text{miss}}$$

transverse mass of lepton and E_T^{miss}

$$m_{\text{CT}}(\text{lep1}, \text{lep2}) = [E_T(\text{lep1}) + E_T(\text{lep2})]^2 - [p_T(\text{lep1}) + p_T(\text{lep2})]^2$$

cotransverse mass of two leptons

$$m_T = \sqrt{2p_T^{\text{lep}} E_T^{\text{miss}} - 2\mathbf{p}_T^{\text{lep}} \cdot \mathbf{p}_T^{\text{miss}}}$$

cotransverse mass of 2b-jets

$$m_{\text{CT}}^2 = (E_T^{b_1} + E_T^{b_2})^2 - |\mathbf{p}_T^{b_1} - \mathbf{p}_T^{b_2}|^2$$
$$\approx 2p_T^{b_1} p_T^{b_2} (1 + \cos \Delta\phi_{bb})$$

$$m_{\text{CT}}^{\text{max}} \approx \frac{m_{\text{heavy}}^2 - m_{\text{invisible}}^2}{m_{\text{heavy}}}$$

How to search for SUSY?

SUSY variables

transverse mass of two leptons and E_T^{miss}

$$m_{T2} = \min_{\mathbf{q}_T} \left[\max \left(m_T(\mathbf{p}_T^{\ell 1}, \mathbf{q}_T), m_T(\mathbf{p}_T^{\ell 2}, \mathbf{p}_T^{\text{miss}} - \mathbf{q}_T) \right) \right]$$

relative $E_T^{\text{miss, rel}}$

$$E_T^{\text{miss, rel}} = \begin{cases} E_T^{\text{miss}} & \text{if } \Delta\phi_{\ell, j} \geq \pi/2 \\ E_T^{\text{miss}} \times \sin \Delta\phi_{\ell, j} & \text{if } \Delta\phi_{\ell, j} < \pi/2 \end{cases}$$

α_T

= variable to reject multi-jet events efficiently without significant E_T^{miss} or with transverse energy mismeasurements; for a di-jet event with the less energetic jet: E_{Tj^2} and the transverse mass of the di-jet system:

$$\alpha_T = \frac{E_T^{j2}}{M_T},$$

$$M_T = \sqrt{\left(\sum_{i=1}^2 E_T^{j_i} \right)^2 - \left(\sum_{i=1}^2 p_x^{j_i} \right)^2 - \left(\sum_{i=1}^2 p_y^{j_i} \right)^2}$$

for back-to-back jets with $E_{Tj^2} = E_{Tj^1}$ $\alpha_T = 0.5$

How to search for SUSY?

Razor variables

- looks at the rest frame of the heavy SUSY particles (R-frame)
- exploit the symmetry in the visible portion of pair-produced sparticles decays
- decay products of a single sparticle decay are grouped in a mega-jet
= symmetric chains in the rest frame of the sparticles
- in the R-frame each sparticle has about the same mass m_{heavy}

- energy of the mega jets E_1, E_2
$$E_1 = E_2 = \frac{m_{\text{Heavy}}^2 - m_{\text{LSP}}^2}{2 \times m_{\text{Heavy}}}$$

- characteristic mass $M_R = 2 \times E_1 = 2 \times E_2$

- in the lab frame:
$$M'_R = \sqrt{(j_{1,E} + j_{2,E})^2 - (j_{1,z} + j_{2,z})^2}$$

with: $j_{i,E}$ = energy mom. of mega-jet, $j_{i,z}$ = longitud. momentum

- transverse information of the system
$$M_T^R = \left[\frac{1}{2} \times |\mathbf{E}_T^{\text{miss}}| \times (|j_{1,T}| + |j_{2,T}|) - \frac{1}{2} \times \mathbf{E}_T^{\text{miss}} \cdot (j_{1,T} + j_{2,T}) \right]^{1/2}$$
- Razor variable: $R = M_T^R / M'_R$

SM → small values, SUSY between 0-1

Natural SUSY

Expect light stop, sbottom, not-too heavy gluino, and light higgsinos (gauginos)

Tree-level: Higgsino $< \sim 350$ GeV

One loop: stop $< \sim 1$ TeV

Two loops: gluino $< \sim 2$ TeV

LLP – disappearing track

Many SUSY model e.g. AMSB have almost mass degenerate chargino and LSP \rightarrow long-lived chargino

Chargino travels into detector before decaying to soft pion + LSP \rightarrow disappearing track

Trigger on ISR jet
Look for isolated, high p_T tracks with < 5 TRT hits

Background track p_T shape taken from data

Signal + background template fit for candidate tracks

No significant excess observed

Consider the LSP to be long-lived, decaying to a muon and jets
Dedicated reconstruction of tracks and vertices

Trigger with one high- p_T muon

Search for a displaced vertex (DV)
within $r < 180$ mm and $|z| < 300$ mm
 $m_{DV} > 10$ GeV and > 4 tracks

To suppress hadronic interactions, veto
vertices from regions of high density

Dominating background from hadronic interactions with
gas molecules (outside beampipe)

Usually low mass, but random track crossing can give high mass

Model m_{DV} with jet-
triggered events

Random track combination
background negligible

Expected 0.02 ± 0.02 events
Observed 0

Long-lived gluino R-hadrons

A beam-halo candidate event during an unpaired bunch crossing in data.

A candidate event display from 2011 data passing all selections

A cosmic ray muon candidate event during an empty bunch crossing in data

Muon segments are drawn but not reconstructed

R-parity violation (RPV)

RPV stop searches (arXiv: 1306.6643)

MSUGRA = Gravity-Mediated Supersymmetry Breaking

= most studied scenario is the 5 parameter mSUGRA model

M_0 : common boson mass at GUT scale
 $M_{1/2}$: common fermion mass at GUT scale
 $\tan \beta$: ratio of higgs vacuum expectation values
 A_0 : common GUT trilinear coupling
 μ : sign of Higgs potential parameter

GMSB = Gauge Mediated Supersymmetry Breaking

- Gauge Mediated Supersymmetry Breaking is method of communicating supersymmetry breaking to the supersymmetric Standard Model through the Standard Model's gauge interactions. Typically a hidden sector breaks supersymmetry and communicates it to massive messenger fields that are charged under the Standard Model. These messenger fields induce a gaugino mass at one loop and then this is transmitted on to the scalar superpartners at two loops.
- the maximum Higgs boson mass predicted is just 121.5 GeV \rightarrow with the Higgs being discovered at 125 GeV - this has likely been disproved

Gauge mediated SUSY breaking can be understood in terms of loop effects in a renormalizable framework (in contrast to mSUGRA).

Parameters (general model has 124):

- Λ : Breaking scale
- M : Mass scale of the messengers
- $\tan\beta$: Ratio of Higgs vacuum expectation values
- N : Number of messenger chiral supermultiplets
- $\text{sign}(\mu)$: Sign of the Higgs mass parameter
- C_{grav} : Scale factor of the Gravitino mass → lifetime of NLSP

AMSB = Anomaly Mediated Supersymmetry Breaking

- Characteristic near-degeneracy of χ_1^0 (LSP) and χ_1^+ masses
- $\Delta m < m(\pi)$
 - Long lived χ_1^+
 - ‘cannonball’
- $\Delta m > 1 \text{ GeV}$
 - multi-hadron decay

- Our Model:
 - RPC
 - $\tan\beta = 10$
 - $m_{3/2} = 36 \text{ TeV}$
 - $m_0 = 500 \text{ GeV}$
 - $\mu +ve$

- Giving:
 - $m(\chi^+) = 99.0 \text{ GeV}$
 - $m(\chi^0) = 98.4 \text{ GeV}$
 - $\Delta m = 631 \text{ MeV}$
 - $c\tau = 360 \mu\text{m}$

Examine model with $c\tau \Rightarrow$ vertexing
